# Fertiglobe plc

Abu Dhabi Securities Exchange · FERTIGLB | Nitrogen fertilisers

Valuation study, 9 August 2026 · price basis 2026-08-07 · reported in US dollars, priced in dirhams

### READ FIRST

This is an educational valuation study. It is not investment advice, it is not a recommendation, and it contains no rating and no price target. What it contains is a range of fair value produced by four independent methods, and a probability distribution for the share price over the next one and three months. Both are estimates and both can be wrong.

**What this study is built from.** Every historical figure comes from Fertiglobe plc's own issued financial statements, downloaded from the company's investor-relations archive. Four complete audited financial years were obtained — 2022, 2023, 2024 and 2025 — together with the interim statements for the first quarter and first half of 2026. No data vendor, broker note or press report was used as the source of any figure the company itself reports. Market multiples for comparable companies are the one exception, and they are used only as a cross-check and labelled as such.

**The currency.** Fertiglobe reports and functions in US dollars. Its shares trade in dirhams on the Abu Dhabi Securities Exchange. The valuation is therefore built in dollars, which is the currency of the company's revenue, its gas contracts and almost all of its debt, and translated to dirhams per share at the central bank peg of 3.6725 only at the final step.

**The single most important judgement.** The company's gas cost in Egypt and Algeria moves with the price of the product it makes. That one fact governs how much of a fertiliser price rise the company actually keeps. It is measured here from disclosed data rather than assumed, and the question it raises — whether today's elevated prices persist — is answered twice, not once. Both answers are carried through to a value and published side by side.

## Headline

This study reaches TWO answers rather than one, and which of them is right turns on a single question about the nitrogen market. Read on a normalisation to the marginal cost of the high-cost swing supplier, the cash-flow method values Fertiglobe at AED 1.81 per share. Read on the current tightness persisting, it values the same company at AED 2.68. The market price is AED 2.54 on 2026-08-07, which sits between them — -28.7% against the first and 5.7% against the second.

The two are published side by side and are NOT averaged. Their midpoint would be AED 2.25, a number neither reading supports and one that would assert a disagreement with the market that neither reading actually makes. Where two readings disagree this study publishes the disagreement and says what decides it.

The company earned 1,025 million of EBITDA in 2025 on 2,827 million of revenue. In the first half of 2026 alone it earned 713 million of adjusted EBITDA on 2,001 million of revenue, as conflict in the Middle East closed the Strait of Hormuz and drove urea from $440 to $637 per tonne. The central question for a buyer today is how much of that is durable.

**The finding that matters.** A naive reading of the first half of 2026 doubles the company's earnings power. That reading is wrong, and the company said so itself. Gas pricing in Egypt and Algeria is linked to the product price, so the cost side rises with the revenue side. Measured across the three periods the company has disclosed, roughly 48% of every incremental dollar of realised price is absorbed by cost before it reaches profit. A model that escalated costs on general inflation instead would have overstated the value of this company by a wide margin.

# Valuation summary

| Method | What it measures | Value (AED/share) | Role | Note |
|---|---|---|---|---|
| **Cash flow — marginal-cost anchor** | **Five years of free cash flow to the firm, then a terminal block** | **1.81** | **THE ANSWER** | **Terminal value is 56.3% of enterprise value** |
| **Cash flow — tightness persists** | **The same model on the second reading of the nitrogen market** | **2.68** | **THE ANSWER** | **Terminal value is 62.0% of enterprise value** |
| **Relative multiples** | Mid-cycle EBITDA on a peer-anchored enterprise multiple | 2.06 | Cross-check | 5.8 times enterprise value to EBITDA |
| **Book value and sustainable return** | Book equity marked to the return it earns | 1.27 | Floor | A disclosed floor, not a valuation — see section 1.2 |
| **Market price** | | 2.54 | | 2026-08-07 |

*Summary valuation table. The cash-flow method IS the answer and it has two readings; the multiple stands beside it as a cross-check and book value as a floor. Neither is weighted into the answer, and the two readings are not averaged. Terminal value as a share of enterprise value is shown against the cash-flow method because that method is the one it applies to.*

## The same company, valued twice

The price of nitrogen fertiliser over the next five years is the study's central contested judgement, and there is no honest way to settle it from the evidence available today. Rather than average two views into one number that nobody holds, both are computed in full and published side by side.

| | Framing A — normalisation | Framing B — structurally tight |
|---|---|---|
| **The argument** | The 2026 spike is a war premium. As the Strait reopens and Chinese exports resume, prices fall back toward the marginal cost of European production. | Demand growth outside China of about 11.4 million tonnes to 2030 outpaces roughly 9.1 million tonnes of additions, and European tariffs on Russian product keep rising. Prices hold near recent levels. |
| **Urea by 2028 ($/t)** | 440 | 550 |
| **Ammonia by 2028 ($/t)** | 420 | 530 |
| **EBITDA by 2030 ($m)** | 1,024 | 1,385 |
| **Enterprise value ($m)** | 6,140 | 8,804 |
| **Terminal value share of enterprise value** | 56.3% | 62.0% |
| **Value (AED/share)** | **1.81** | **2.68** |

*The two framings are not a bull case and a bear case. They are two defensible readings of the same evidence, and the difference between them is the honest measure of what is not known.*

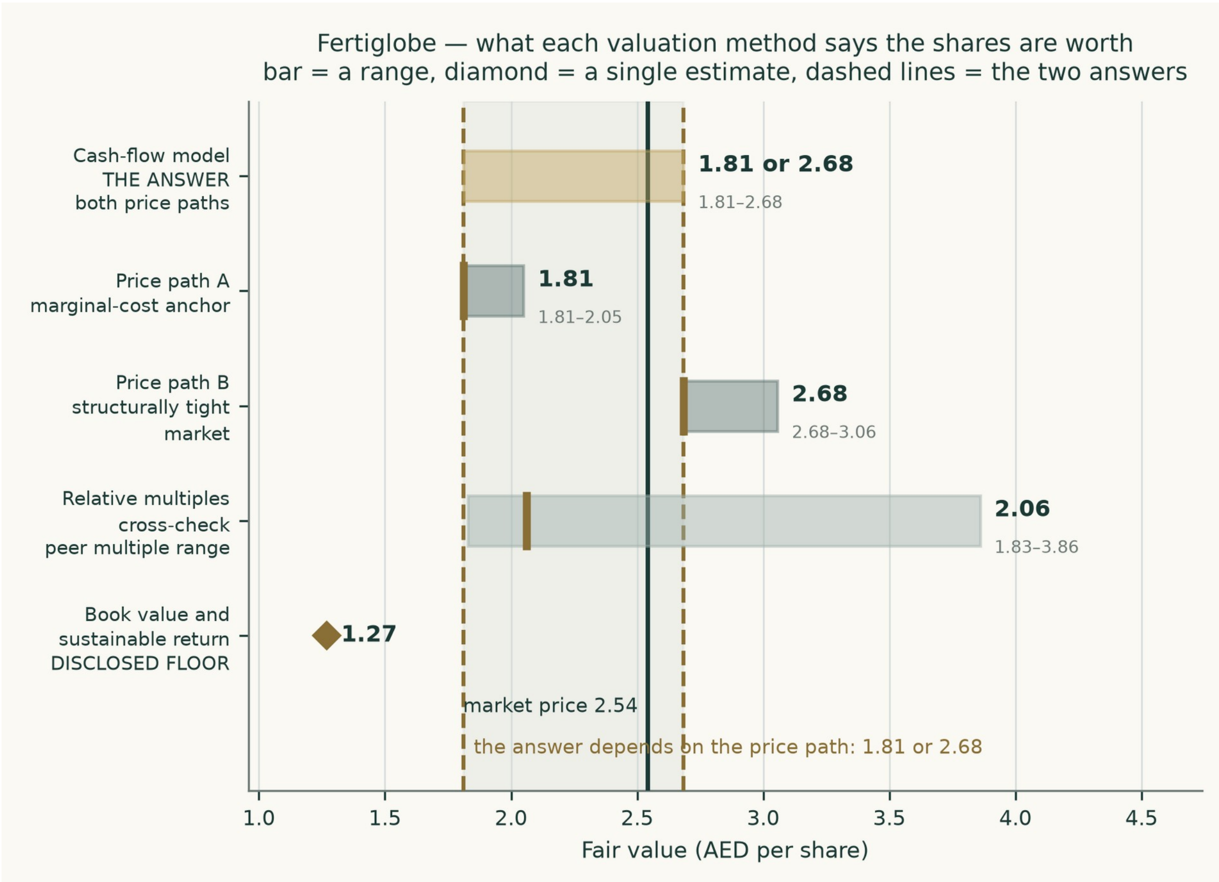

*Figure 1. The four valuation methods and the two price framings, against the market price.*

# Company overview

Fertiglobe plc produces and sells nitrogen-based fertilisers — ammonia and urea — from four plants across three countries, and markets both its own output and product bought from third parties. It is the largest nitrogen fertiliser producer in the Middle East and North Africa and describes itself as the world's largest seaborne exporter of urea and net ammonia combined. It listed on the Abu Dhabi Securities Exchange on 27 October 2021. Abu Dhabi National Oil Company completed its purchase of OCI N.V.'s entire holding in October 2024 and now owns 87.4%, leaving a free float of 12.6%.

| Plant | Country | Ownership | Urea capacity (Mt) | Ammonia capacity (Mt) |
|---|---|---|---|---|
| **Egyptian Fertilizers Company** | Egypt | 100% | 1.4 | 0.4 |
| **Egypt Basic Industries Corporation** | Egypt | 75% | — | 0.7 |
| **Sorfert Algérie** | Algeria | 51% | 1.3 | 0.8 |
| **Ruwais Fertilizer Industries** | United Arab Emirates | 100% | 2.1 | 0.1 |

*Plant footprint. Group merchant capacity is 5.1 million tonnes of urea and 1.5 million tonnes of merchant ammonia, the ammonia figure being net of what is consumed internally to make urea.*

## Why this is valued as an operating company

The classification matters more than any other single decision in a study, because it determines which method is used, and a wrong classification invalidates everything downstream. Three facts from the filings settle it here.

- **All revenue comes from** the sale of nitrogen products. The FY2025 segment note states the group has "one revenue stream from contracts with customers which is the sales of Fertilizers products (Ammonia and Urea)". There is no lending book, no rental stream and no development pipeline.
- The two reportable segments are production and marketing of own-produced volumes, which earned 2,332 million of revenue in 2025 at a 45.4% EBITDA margin, and third-party trading, which earned 495 million at 3.8%. The second is a working-capital business attached to the first, not a separate enterprise needing its own method.
- The balance sheet is plant. Property, plant and equipment of 2,499 million out of 4,950 million of total assets, with no investment property and no portfolio of equity stakes. The subsidiaries are consolidated operating plants, not holdings — which is what distinguishes this from a holding company.

The company is therefore valued on free cash flow to the firm, cross-checked by multiples, by normalised earnings power and by book value. It does not straddle two classes, so the legs are not split.

# 1. Fundamental valuation

## 1.1 Cash-flow model

The model runs five forecast years against three years of history. Volumes come from installed capacity times utilisation; prices from published benchmarks times a measured realisation ratio; costs from a pass-through relationship calibrated against the company's own disclosed segment economics. The 2026 forecast year is not modelled in full — the first half is already reported, and is carried as reported, with only the second half forecast.

| US$ million | 2026 | 2027 | 2028 | 2029 | 2030 |
|---|---|---|---|---|---|
| **Revenue** | 3,770 | 3,267 | 3,095 | 3,121 | 3,164 |
| **EBITDA** | 1,334 | 1,105 | 1,017 | 1,016 | 1,024 |
| **Depreciation and amortisation** | 305 | 315 | 325 | 333 | 340 |
| **EBIT** | 1,029 | 790 | 692 | 683 | 684 |
| **EBITDA margin** | 35.4% | 33.8% | 32.8% | 32.6% | 32.4% |
| **Tax at 13.1%** | 135 | 104 | 91 | 90 | 90 |
| **NOPAT (EBIT after tax)** | **894** | **686** | **601** | **594** | **594** |
| **depreciation and amortisation added back** | 305 | 315 | 325 | 333 | 340 |
| **capital expenditure** | -175 | -240 | -285 | -315 | -335 |
| **change in working capital — a release adds, a build subtracts** | -139 | 74 | 26 | -3 | -6 |
| **Free cash flow to the firm** | **885** | **835** | **666** | **608** | **593** |
| **Discount factor** | 0.8949 | 0.8020 | 0.7198 | 0.6469 | 0.5822 |
| **Present value of free cash flow** | **792** | **670** | **480** | **394** | **345** |

*Figure in full: the free cash flow waterfall under framing A, from EBITDA to the present value of each year's cash flow. Framing B follows the identical structure on the higher price path.*

| Enterprise value to equity | US$ million | Note |
|---|---|---|
| **Present value of forecast free cash flow** | 2,680 | Five years, discounted at 11.9% declining to 11.1% |
| **Present value of terminal value** | 3,459 | 56.3% of enterprise value |
| **Enterprise value** | 6,140 | |
| **less net debt** | **-621** | **At 30 June 2026** |
| **less non-controlling interests** | -1,451 | Proportionate share of equity value — see below |
| **Equity attributable to owners** | 4,067 | |
| **Value per share (US$)** | 0.4930 | |
| **Value per share (AED)** | 1.81 | At the peg of 3.6725 |

*The enterprise value to equity bridge, framing A. Terminal value as a share of enterprise value is 56.3%.*

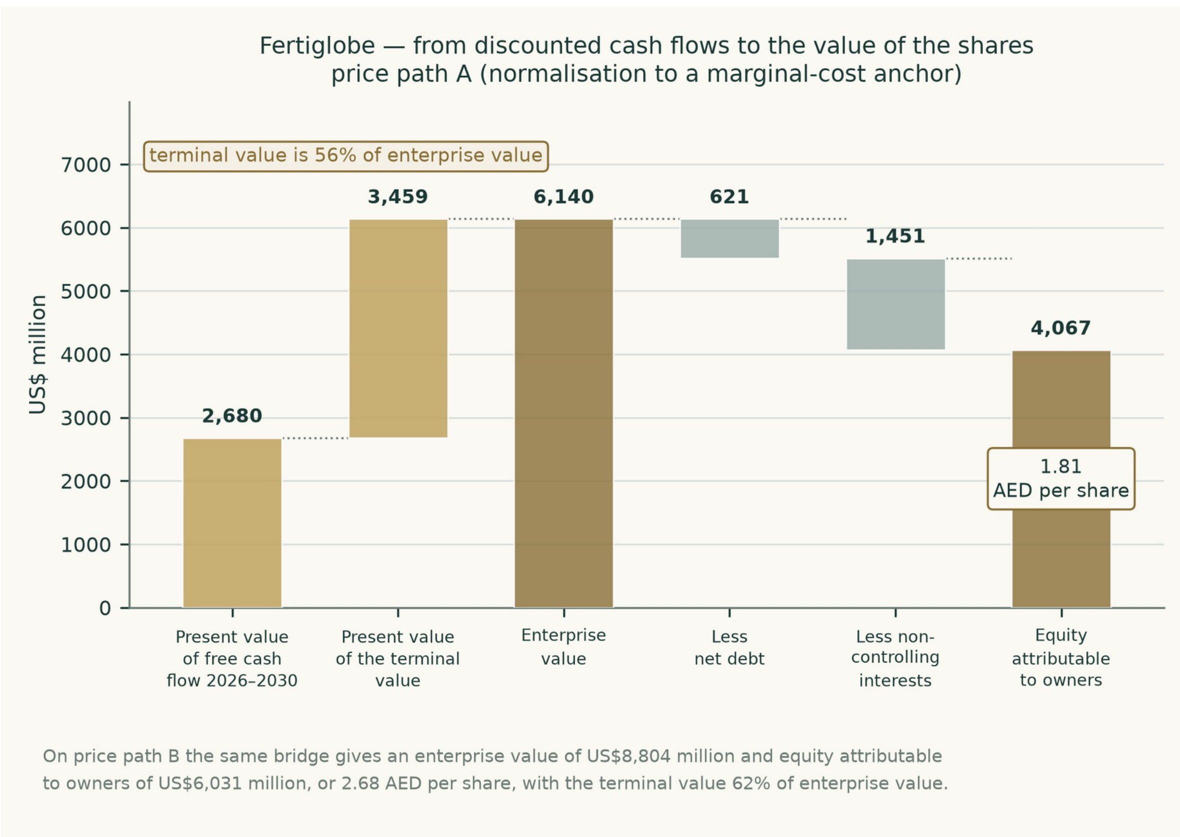

*Figure 2. From cash flow to equity value: the bridge in picture form.*

Non-controlling interests are unusually large here and deserve their own sentence. Outside shareholders own 49.01% of Sorfert in Algeria and 25.0% of Egypt Basic Industries, and together took 26.3% of group profit in 2025. Because the cash flows discounted above are the consolidated ones, that share must come out. Deducting it on a proportionate-earnings basis gives AED 1.81 per share; deducting the book value of those interests instead gives AED 2.26. The earnings basis is used because it reflects what those shareholders actually own — a share of the cash flows, not a share of a historical cost figure — and it is the more conservative of the two. Both are shown so the reader can see the size of the choice.

## 1.2 Book value and sustainable return

Book equity attributable to owners was 1,356 million at the end of 2025, or AED 0.60 per share. The return on that equity averaged 23.0% over the last three years, against a cost of equity of 12.0%. Capitalising the excess gives a justified price-to-book of 2.10 times and a value of AED 1.27.

This is the weakest of the four lenses for this particular company, and it is given the smallest weight for a specific reason rather than a general one. The reserves line carries a negative balance of 1,118 million, described in the accounts as net repayments of equity to previous shareholders out of contributions made in earlier years. Book equity is therefore a legacy of the pre-listing capital structure rather than a measure of capital employed today, which simultaneously deflates book value per share and inflates the apparent return on it. The two distortions partly offset in the formula above, but not reliably, and a reader should treat this lens as a sanity check rather than as evidence.

## 1.3 Relative multiples

| Company | Market | Enterprise value to EBITDA | Character |
|---|---:|---:|---:|
| **Nutrien** | US | 7.4x | diversified nutrient, retail attached |
| **CF Industries** | US | 6.1x | pure nitrogen, Henry Hub advantaged |
| **Yara International** | NO | 5.2x | nitrogen, European gas cost |
| **OCI Global** | NL | 5.6x | nitrogen and methanol |
| **Industries Qatar** | QA | 9.1x | Gulf petrochemical and fertiliser |
| **SABIC Agri-Nutrients** | SA | 10.4x | Gulf nitrogen, Tadawul rating |
| **Fertiglobe — applied** | **AE** | **5.8x** | **Below the Gulf peers, above the European ones** |

*Comparable companies. Peer multiples are market data used as a cross-check; they are not a source for any Fertiglobe figure.*

The applied multiple of 5.8 times sits deliberately between the two clusters. Fertiglobe earns Gulf gas economics on part of its base, which argues for the higher end, but a third of its assets sit in Egypt and a sixth in Algeria, which argues for the lower. Applied to mid-cycle EBITDA of 1,191 million — the average of the last three forecast years across both price framings — it gives AED 2.06 per share. On trailing figures the shares change hands at 4.4 times enterprise value to EBITDA, annualising the first half of 2026, which flatters the multiple because that half was exceptional.

## 1.4 Normalised earnings power

Stripping out the cycle, mid-cycle revenue of 3,458 million at the three-year average EBITDA margin of 36.2% gives 1,250 million of EBITDA, 925 million of EBIT after depreciation, and 571 million of profit attributable to owners after interest, tax and minorities. That is US$ 0.0692 per share. At 11 times — a modest multiple for a capital-intensive commodity producer with a controlling shareholder and a thin float — the shares are worth AED 2.79.

## 1.5 Synthesis — one method answers, the others check it

The cash-flow method IS the answer here, and it is the only one that prices the specific mechanism this company runs on — the link between its selling price and its gas cost. It reaches two figures rather than one, AED 1.81 and AED 2.68, because the question it cannot settle is where nitrogen prices sit through the cycle rather than anything about the company itself.

The other methods stand beside it as checks and are not weighted into it. The relative multiple reads AED 2.06, which is what the market pays for comparable assets rather than what this business generates. Book value reads AED 1.27 and is published as a FLOOR — a disclosed number this company is worth at least, not an estimate of what it is worth. Neither enters the answer.

An earlier edition of this study blended four methods at fixed weights and published their weighted centre. That construction is retired. The weights had never been tested against anything, two of the four methods valued a commodity producer on reported accounting figures, and — worse here — the blend averaged the cash-flow method's own two readings into a single number that neither reading supports. Where methods disagree this study now publishes the disagreement.

## 1.6 Drivers

Each disclosed segment is grown on its own driver. Margins are outputs of the build, never inputs to it.

| Driver | How it is built | Source |
|---|---|---|
| **Own-produced sales volume (kt, by product)** | Installed capacity by plant and product is disclosed, and quarterly sales volumes are disclosed by product. Volume is capacity times utilisation, both sourced. | Bottom-up |
| **Realised price per tonne ($/t, by product)** | Published benchmark prices by product and region, multiplied by a realisation ratio measured against disclosed segment revenue over three independent periods. | Bottom-up |
| **Cash cost per tonne ($/t)** | Calibrated against realised price from disclosed segment revenue and EBITDA over three periods, and cross-checked physically against gas consumption intensity and the disclosed delivered gas price. | Bottom-up |
| **Third-party trading revenue and margin** | Volumes are disclosed but purchase prices are not, so the leg is carried at a segment margin measured from disclosed segment EBITDA. The gap is flagged: this is the one leg not built from unit economics. | Segment level — gap flagged |
| **Forecast tax rate** | Average of three sourced estimates computed on the workbook sheet — four-year aggregate effective, four-year aggregate cash, and a jurisdiction-weighted statutory build on disclosed asset weights. | Bottom-up |
| **Working capital** | Projected from the receivable, inventory and payable days measured off the filed statements, with the gas accrual removed from payables because it is not a trade payable in the ordinary course. | Bottom-up |
| **Equity risk premium** | Each operating country priced off its own published sovereign row and weighted by disclosed non-current assets by country. | Bottom-up |
| **Cost of debt** | The company's own most recent borrowings, tranche by tranche, at their disclosed margins over the reference rate. | Bottom-up |
| **Beta** | Regression of the share's own weekly returns against an equal-weight composite of the local market over the full listed history. | Bottom-up |

*The driver table. Eight of the nine drivers are built from unit economics. The ninth — third-party trading — is carried at a segment margin because the company discloses traded volumes but never a purchase price, and that gap is stated rather than papered over.*

The two unit relationships that matter are worth showing directly, because both were measured rather than assumed.

| | FY2024 | FY2025 | H1 2026 |
|---|---|---|---|
| **Own-produced volume (kt)** | 5,345 | 5,498 | 2,571 |
| **— of which urea** | 4,225 | 4,228 | 2,045 |
| **— of which ammonia** | 1,119 | 1,267 | 523 |
| **Volume-weighted benchmark ($/t)** | 355 | 418 | 628 |
| **Realised price ($/t)** | 355 | 424 | 621 |
| **Realisation ratio** | 0.998 | 1.016 | 0.989 |
| **Cash cost ($/t)** | 224 | 231 | 345 |

| | FY2024 | FY2025 | H1 2026 |
|---|---|---|---|
| **EBITDA margin, own product** | 36.8% | 45.4% | 44.4% |

*The unit build, measured across three independently disclosed periods. The realisation ratio — what the company actually gets against the published benchmark — sat within two percent of one in all three, which is what makes it usable as a forward driver.*

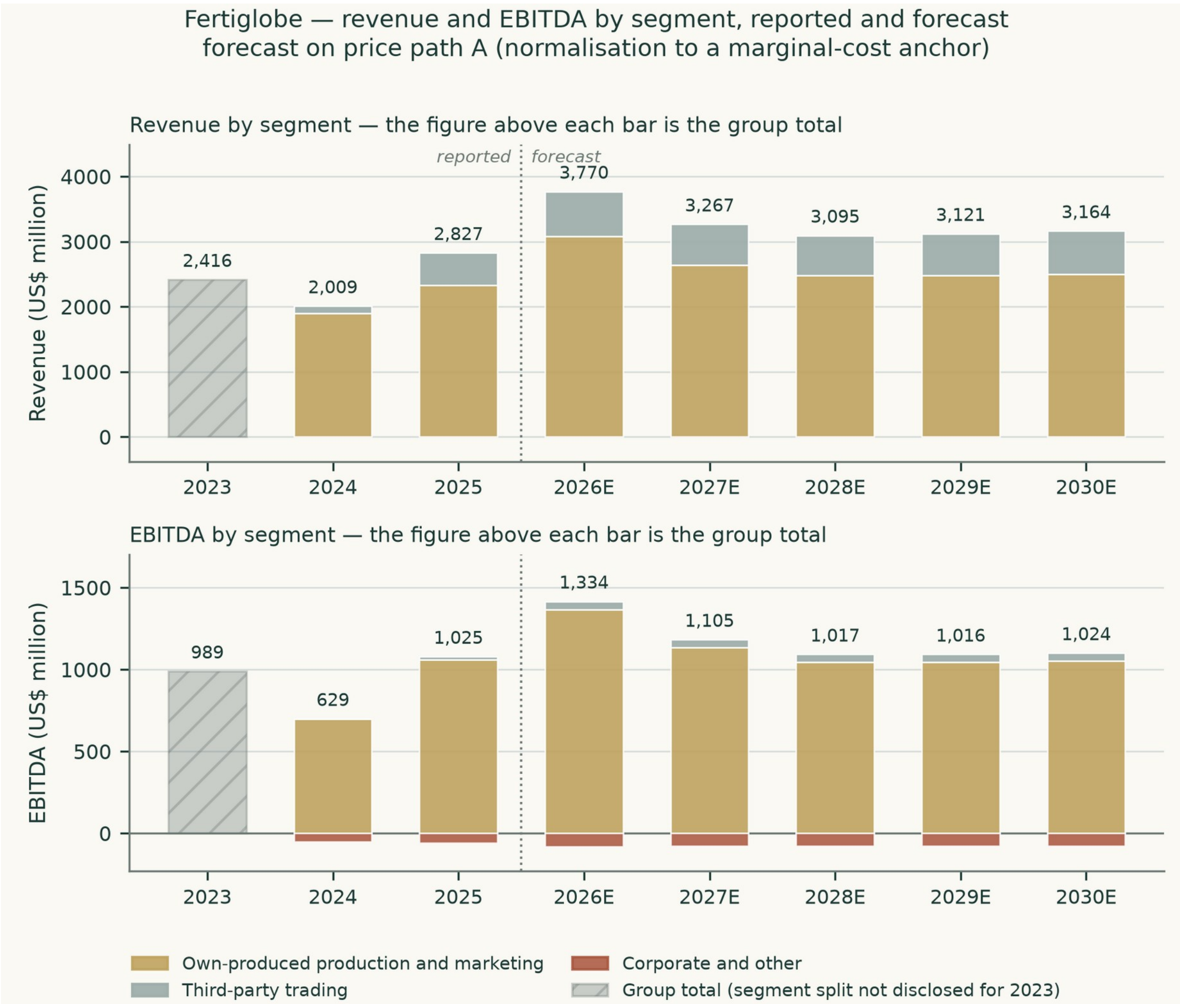

*Figure 3. Revenue and profit by segment, reported and forecast.*

## 1.7 The crux

### Everything above turns on one question: when the price of urea rises by a dollar, how much of that dollar does Fertiglobe keep?

The FY2025 audited segment note says the production entities "all benefit from long term gas offtake agreements with no/limited price exposure on the supply of natural gas". Read alone, that says the company keeps almost all of it, and a model built on that reading would value Fertiglobe very highly indeed on 2026 prices.

The chief executive said something different on the second-quarter results call on 6 August 2026: "we have gas-linked — sorry, product-linked gas pricing effectively in both Egypt as well as Algeria. So, product prices are very strong. We'll see a higher gas cost." He put the delivered gas price for the second quarter at $6 per million British thermal units, or $8 including the Algerian profit-share arrangement.

These two statements cannot both be complete. The study resolves the conflict in favour of the more recent and more specific one, and then does the thing that settles it properly — measures the relationship from the company's own numbers.

| Period | Realised price ($/t) | Cash cost ($/t) | Change in price | Change in cost |
|---|---|---|---|---|
| **FY2024** | 355 | 224 | | |
| **FY2025** | 424 | 231 | 69 | 7 |
| **H1 2026** | 621 | 345 | 197 | 114 |

*Cost against price, from disclosed segment revenue and segment EBITDA divided by disclosed own-produced volume. Three periods, three independent filings.*

Regressing cash cost per tonne on realised price per tonne across those three periods gives a slope of 0.481 with an R-squared of 0.960. In plain terms: about 48% of every additional dollar of price is consumed by cost before it reaches profit. Three observations is a small sample and the study says so plainly — but two independent checks support it.

- The relationship survives removing the Algerian gas accrual. That accrual is a retrospective catch-up rather than a run rate, and stripping it out changes the slope only from 0.481 to 0.489. The link is therefore not an artefact of that one item.
- The physics agrees. At roughly 24 million British thermal units of gas per tonne of product sold, the observed cost increase between 2025 and the first half of 2026 implies the delivered gas price rose by about $4.74 per unit. Working back from the $6 the chief executive disclosed for the second quarter puts the earlier price near $1.26 — which is exactly where legacy Algerian and Egyptian contract gas would be expected to sit. The accounting and the engineering arrive at the same place by different routes.

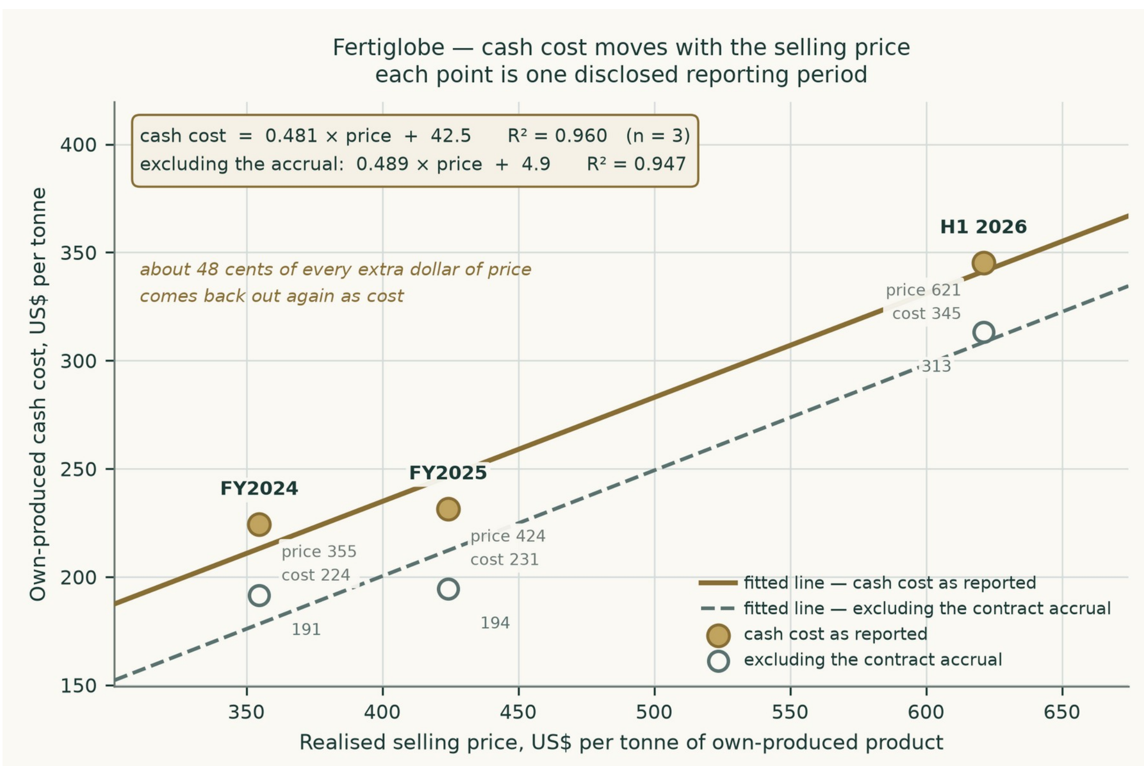

*Figure 4. Cash cost per tonne against realised price per tonne, with the fitted relationship. This is the study's central piece of evidence.*

**Why this cuts both ways.** The link is not simply bad news. It is what the chief executive called right-way risk: when prices fall, the gas cost falls with them, and the margin is defended from below as well as capped from above. It makes Fertiglobe a less volatile business than its revenue line suggests — and a less explosive one than the first half of 2026 suggests.

## 1.8 Macro and country

Fertiglobe operates across three sovereigns with very different risk, and the cost of capital is built from the ground up to reflect that rather than treating the company as purely Emirati.

| Country | Rating | Default spread | Equity risk premium | Non-current assets |
|---|---|---|---|---|
| **Abu Dhabi** | Aa2 | 0.42% | 4.9% | 50.9% |
| **Egypt** | Caa1 | 6.37% | 13.9% | 31.1% |
| **Algeria** | Not rated | 3.83% | 10.1% | 16.1% |
| **Other** | — | — | 4.2% | 1.9% |
| **Weighted** | | | **8.5%** | **100%** |

*Each country is priced off its own published sovereign row and weighted by where the plants actually are. Treating the company as purely Emirati would have used 4.9% instead of 8.5% — a difference that would have flowed straight into the valuation.*

The risk-free rate is normalised so sovereign risk is counted once and not twice. The Abu Dhabi dollar sovereign yields about 5.1%, being the US 10-year Treasury at 4.7% plus the emirate's own credit spread. Removing that same spread again leaves a normalised risk-free rate of 4.7%. Country risk then enters once, inside the equity risk premium above. Using the raw local yield together with a country-loaded premium would have double-counted it.

| Component | Rating basis | Credit-default-swap basis | Source |
|---|---|---|---|
| **Normalised risk-free rate** | 4.7% | 4.7% | Abu Dhabi dollar sovereign, net of its own default spread |
| **Beta** | 0.931 | 0.931 | Own-share weekly regression, 4.68 years, n=242 |
| **Equity risk premium** | 8.5% | 7.1% | Asset-weighted across the three operating countries |
| **Cost of equity** | 12.7% | 11.3% | |
| **Cost of debt before tax** | 5.7% | 5.7% | Marginal — see the evidence table below |
| **Cost of debt after tax** | 4.9% | 4.9% | At the forecast tax rate of 13.1% |
| **Weight of equity** | 90.2% | 90.2% | Market capitalisation |
| **Weighted average cost of capital** | 11.9% | 10.7% | |
| **Terminal cost of capital** | **11.1%** | **10.1%** | **At a normalised 20.0% debt weight** |

*The cost of capital, published on both premium bases as the house method requires. The rating basis is used for the headline; the credit-default-swap basis is shown because Algeria has no traded swap, so that column is not fully comparable.*

The cost of debt is marginal and forward-looking, taken from the company's own most recent borrowings rather than from anything historical.

| Facility | Amount | Margin | Used? |
|---|---|---|---|
| **Term facilities B and C** | $1,100m | SOFR + 0.90% | Yes — spread renegotiated down from 150 and 140 basis points during 2025 |
| **ADNOC term loan** | $300m | SOFR + 1.05% | Yes — drawn 27 March 2025 |
| **Revolving credit facility** | $600m | SOFR + 1.15% | Undrawn at year end |
| **Sorfert term loan** | $35m | Algerian bank rate + 1.95% | Foreign-currency tranche, carried at local-equivalent cost |
| **Weighted average capitalisation rate** | — | 6.6% | NOT used — this is a historical accounting rate, not a marginal cost |
| **Marginal cost of debt applied** | **—** | **5.7%** | **US 10-year plus the average margin on the two most recent facilities** |

*Cost-of-debt evidence. The rate applied sits above the Abu Dhabi sovereign at 5.1%, as a same-currency corporate must, and below the accounting capitalisation rate the company discloses for a different purpose.*

Debt is 94.9% US dollar denominated, matching the currency of the cash flows. The remaining 5.1% is the Algerian dinar tranche and two Australian dollar trade facilities, both carried at local-equivalent cost rather than at their headline foreign coupon.

The forecast tax rate is not lifted from any single reported year, because no single reported year is representative — the company reported effective rates of 14.0%, 7.0% and 4.0% across the last three, each flattered by items that do not recur. Three independent estimates are computed and averaged:

| Method | Rate | Basis |
|---|---|---|
| **Four-year aggregate effective rate** | 10.4% | Total tax charge over total pre-tax profit, 2022 to 2025 |
| **Four-year aggregate cash rate** | 15.7% | Total tax actually paid over total pre-tax profit, 2022 to 2025 |
| **Jurisdiction-weighted statutory rate** | 13.4% | Published corporate rates weighted by assets in each country |
| **Applied** | **13.1%** | **The average of the three** |

## 1.9 Sensitivity

The value is most sensitive to the gas pass-through rate and to the price path — which is to say, to the crux. It is next most sensitive to beta, which is the study's most fragile input for reasons set out in the caveats.

| Gas pass-through rate | 0.30 | 0.40 | 0.48 | 0.55 | 0.65 |
|---|---|---|---|---|---|
| **Value (AED/share)** | 3.07 | 2.37 | 1.81 | 1.33 | 0.63 |

| Price path shift | -20% | -10% | +0% | +10% | +20% |
|---|---|---|---|---|---|
| **Value (AED/share)** | 1.07 | 1.44 | 1.81 | 2.18 | 2.55 |

| Beta | 0.47 | 0.40 | 0.93 | 0.60 | 1.40 |
|---|---|---|---|---|---|
| **Value (AED/share)** | 2.78 | 3.00 | 1.81 | 2.41 | 1.34 |

| Tax rate | 8% | 11% | 13% | 16% | 20% |
|---|---|---|---|---|---|
| **Value (AED/share)** | 1.93 | 1.86 | 1.81 | 1.74 | 1.65 |

*One-way sensitivities, framing A. The first two lines are the crux; the third is the fragile input.*

| Terminal cost of capital \ real growth | 0.0% | 0.2% | 0.5% | 0.8% | 1.0% |
|---|---|---|---|---|---|
| **10.1%** | 1.99 | 1.98 | 1.97 | 1.96 | 1.95 |
| **10.6%** | 1.90 | 1.89 | 1.87 | 1.86 | 1.85 |
| **11.1%** | 1.81 | 1.80 | 1.78 | 1.77 | 1.75 |
| **11.6%** | 1.73 | 1.72 | 1.71 | 1.69 | 1.67 |
| **12.1%** | 1.66 | 1.65 | 1.63 | 1.62 | 1.60 |

*Two-way sensitivity of value to the terminal cost of capital and terminal growth, in AED per share.*

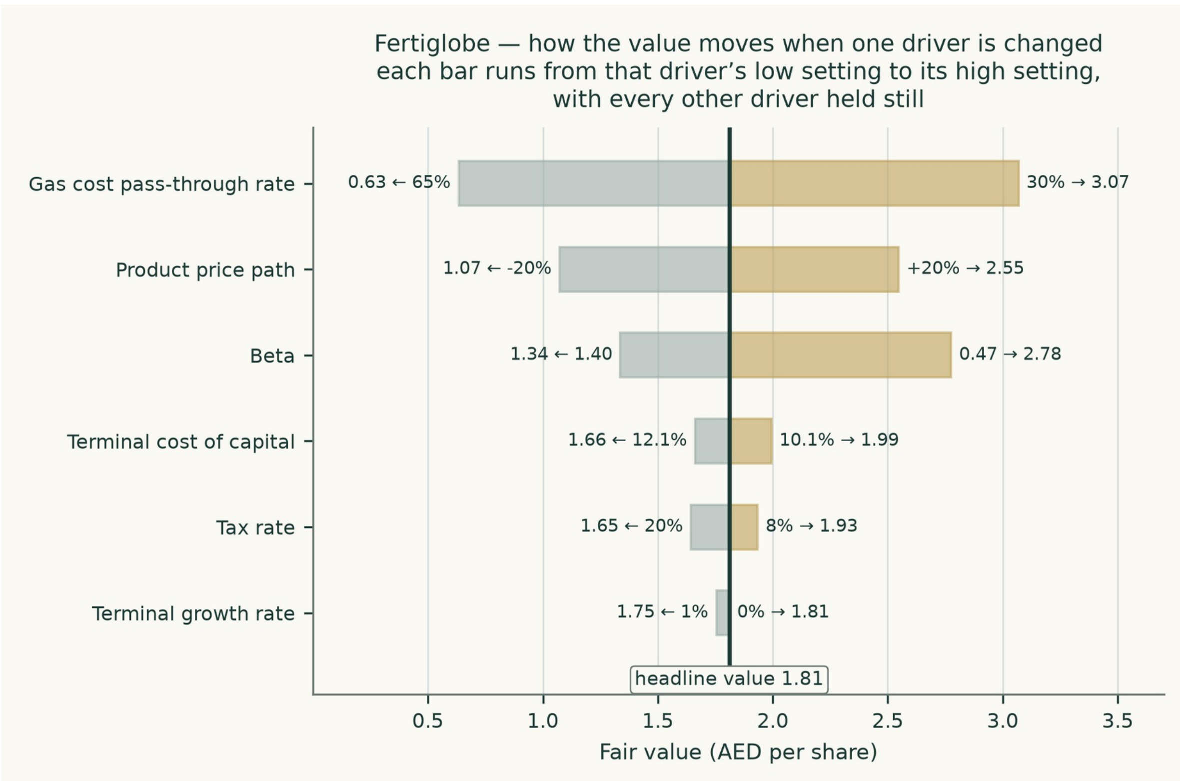

*Figure 5. What moves the value, ranked.*

# 2. Technical and price structure

The price closed 2.54 below a falling 20-day (2.63), a falling 50-day (2.77) and a flat 200-day (2.78). Momentum is soft: RSI(14) is ~34 and the daily ATR near 0.06 (~2.4%) points to a normal tape. MACD (12·26·9) is below zero but turning up (−0.06 / −0.06 / +0.00). The 50-day crossed beneath the 200-day 1 session ago — a fresh death-cross, a momentum-regime change rather than noise inside an intact trend. Over the last year it has ranged 2.35–3.85; the last close sits 34% below that high and 8% above that low.

| Resistance | AED | Support | AED |
|---|---|---|---|
| **R1** | 2.59 | S1 | 2.45 |
| **R2** | 2.69 | S2 | 2.34 |
| **R3** | 2.74 | S3 | 2.25 |

*Resistance and support, nearest first, from clustered price pivots weighted by recency and blended with the moving-average stack.*

| Indicator | Reading |
|---|---|
| **Last close** | AED 2.54 on 2026-08-07 |
| **20-day moving average** | AED 2.63 (falling) |
| **50-day moving average** | AED 2.77 (falling) |
| **200-day moving average** | AED 2.78 (flat) |
| **Relative strength index (14)** | 34 |
| **Average true range (14)** | AED 0.062 (2.4% of price) |
| **52-week range** | AED 2.35 to AED 3.85 |
| **Position in range** | 34.0% below the high, 8.1% above the low |

*Bull case: A daily close back above 2.59 would clear the nearest resistance and open the 2.74 zone.*
*Bear case: A close below 2.45 would break the nearest support and open the 2.25 zone.*

*This section describes the tape and nothing more. It carries no view on the business, because a chart cannot see one.*

# 3. Probability map for the share price

Separately from the valuation above, the study estimates a probability distribution for the share price at one and three months, built from the share's own price history. This is a statement about the range of outcomes, not a forecast of one.

### One month — to 2026-09-07

| Percentile | 5th | 25th | 50th | 75th | 95th |
|---|---|---|---|---|---|
| **Price (AED)** | 2.24 | 2.42 | 2.54 | 2.66 | 2.87 |
| **Change from AED 2.54** | -11.9% | -4.8% | -0.1% | +4.8% | +13.0% |

| Move | ±5% | ±10% | ±15% | ±20% |
|---|---|---|---|---|
| **Chance of touching, up** | 41.6% | 15.7% | 5.3% | 1.8% |
| **Chance of touching, down** | 41.1% | 13.2% | 3.2% | 0.7% |
| **Chance of ending above** | 24.3% | 9.4% | | |
| **Chance of ending below** | 24.3% | 8.1% | | |

### Three months — to 2026-11-09

| Percentile | 5th | 25th | 50th | 75th | 95th |
|---|---|---|---|---|---|
| **Price (AED)** | 2.01 | 2.32 | 2.53 | 2.76 | 3.19 |
| **Change from AED 2.54** | -20.7% | -8.7% | -0.3% | +8.8% | +25.5% |

| Move | ±5% | ±10% | ±15% | ±20% |
|---|---|---|---|---|
| **Chance of touching, up** | 64.8% | 41.9% | 25.7% | 15.6% |
| **Chance of touching, down** | 64.8% | 39.1% | 20.7% | 9.6% |
| **Chance of ending above** | 34.4% | 22.5% | | |
| **Chance of ending below** | 35.3% | 21.6% | | |

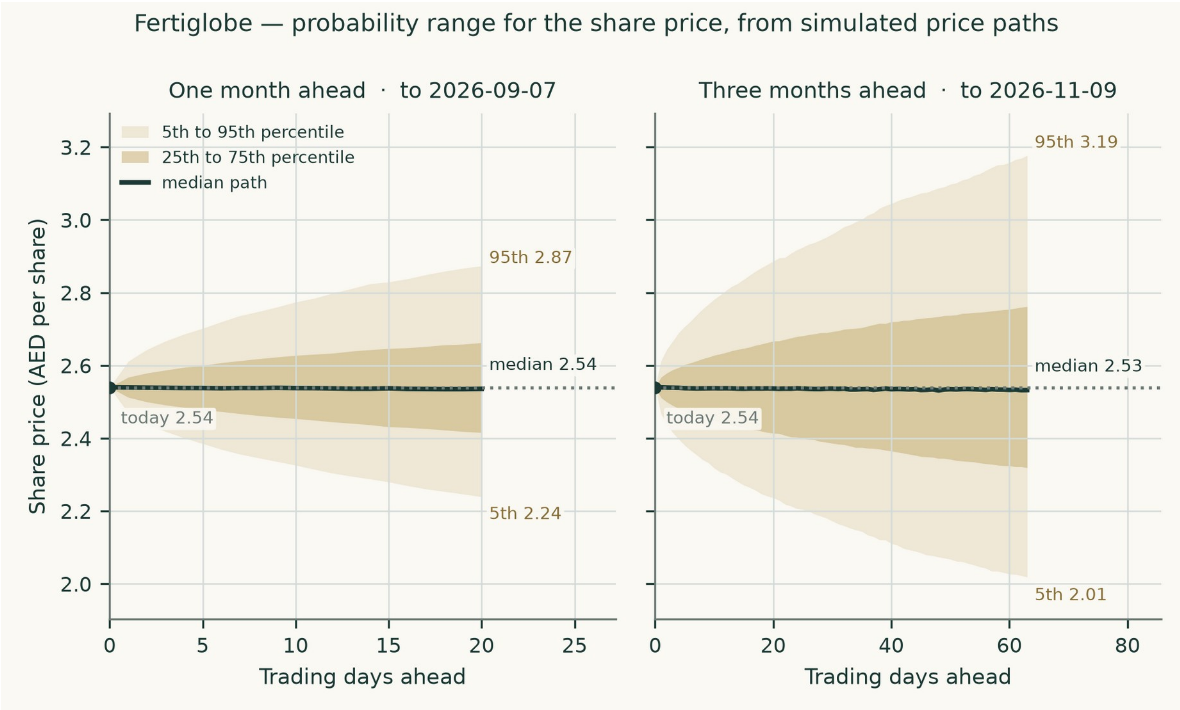

*Figure 6. The one and three month probability ranges.*

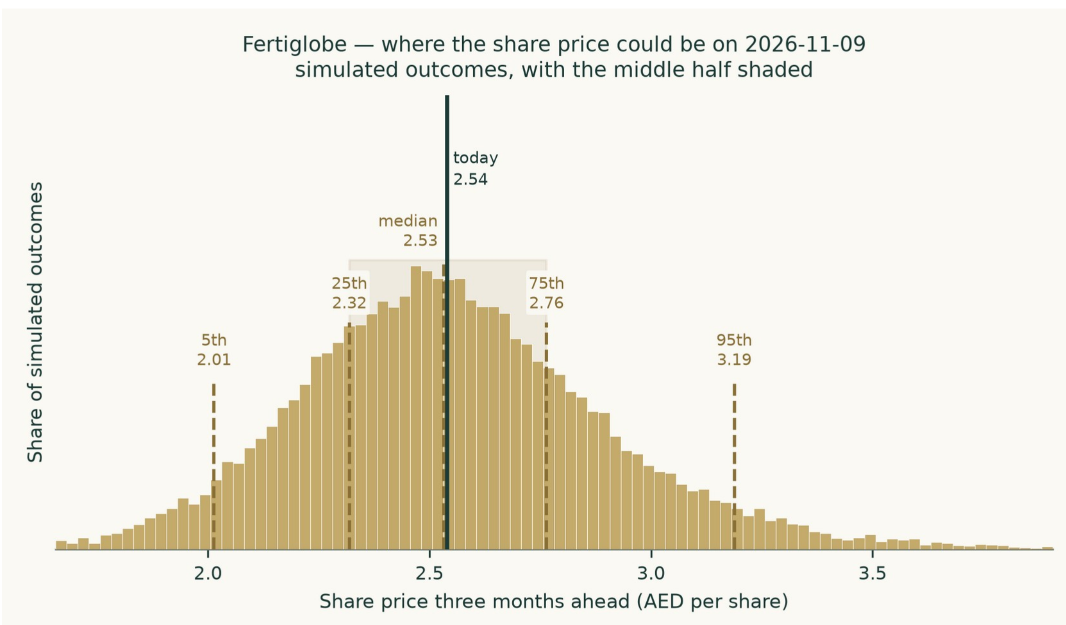

*Figure 7. The distribution of possible prices at three months.*

## How much to trust this

The method was tested against the share's own history before being used. Fertiglobe listed on 27 October 2021, so the price record runs 4.77 years — a literal five-year test is not available for this company, and the test therefore covers the whole of its listed life, which is the maximum evidence that exists. Over 14 independent three-month windows from 2022-11-11 to 2026-02-19, the method scored -0.0015 against a random-walk benchmark that already includes the time value of money. That is statistically indistinguishable from the benchmark: the method neither beat it nor lost to it, and the study says so rather than claiming an edge it did not demonstrate.

Where the method did do well is in the shape of the distribution, which is what a probability range is actually for. Realised outcomes fell across the predicted percentiles roughly evenly — a chi-square test on that spread returns p=0.74 and a Kolmogorov-Smirnov test p=0.44, both comfortably consistent with the bands being honest. Actual outcomes landed inside the 50% band 43% of the time and inside the 90% band 100% of the time.

One caveat is recorded rather than buried. Re-running the same test from five different starting points to get more observations produces a distribution that is no longer evenly spread (p=0.022), with outcomes tilted slightly below the centre of the range. Those runs overlap each other, which makes the statistical test read as more significant than it is, so it is not treated as a verdict — but it is a hint that the centre of the range may sit a little high, and a reader should lean on the width of the bands rather than their midpoint.

# 4. Comparison of the lenses

| Method | Value (AED) | Against the market price | What it assumes that the others do not |
|---|---|---|---|
| **Cash flow — framing A (the answer)** | 1.81 | -29% | That the gas link, the price path and the cost of capital are all right for five years and beyond. Nitrogen prices normalise toward the marginal cost of the high-cost swing supplier, which is where they have spent most of the past decade |
| **Cash flow — framing B (the answer)** | 2.68 | +6% | That the gas link, the price path and the cost of capital are all right for five years and beyond. The tightness in the current market persists, on curtailed European capacity and the gas cost that caused it |
| **Relative multiples (cross-check)** | 2.06 | -19% | That the market is pricing comparable assets sensibly today |
| **Book value (a floor, not a value)** | 1.27 | -50% | That book equity means something — which here it largely does not, so this is read as the floor beneath the others rather than as a method |

The cash-flow lens is the answer and the others sit beside it; none of them is averaged into it. The spread from the floor to the higher framing is close to a factor of two. That is not a failure of the analysis; it is the correct output for a commodity producer whose selling price doubled in six months and whose cost base follows it. Any single number presented without that spread would be more precise than the evidence permits.

A fourth method — capitalising a mid-cycle profit on a justified earnings multiple — is not published here. It reads AED 2.79, and it is left out because the multiple behind it was chosen rather than sourced, and because a mid-cycle margin is exactly what is in dispute for this business: a method that assumes the answer to the question the study is asking cannot then be evidence about it.

# 5. Catalysts

| Catalyst | Direction | What to watch |
|---|---|---|
| **Chinese urea export policy** | Down | Exports were absent until quota guidance in May 2026 and remain minimal. A full reopening is the largest single downside to the price path. |
| **The Strait of Hormuz** | Both | Reopening relieves the logistics cost that hit the first half of 2026 but removes the supply squeeze holding prices up. The two partly cancel. |

| Catalyst | Direction | What to watch |
|---|---|---|
| **Settlement of the Algerian gas contract** | Down / clarifying | The accrued liability reached $469 million by 30 June 2026 with no agreed payment schedule. Settlement converts an estimate into a cash obligation and reveals the true formula. |
| **European tariffs on Russian product** | Up | Already EUR 60 per tonne and scheduled to reach EUR 315 by 2028. Egyptian and Algerian product enters duty free. |
| **The lower-carbon ammonia plant** | Up | One million tonnes, operations expected 2027, total project cost under $500 million. Excluded from this valuation entirely — see below. |
| **European gas prices** | Up | Gas above $20 per unit puts European producers under water and sets a floor under ammonia. It is the mechanism behind the marginal-cost anchor. |

The lower-carbon ammonia project deserves a note because its exclusion is deliberate. The parent is warehousing the project, and Fertiglobe holds only an option to move to 54% ownership after completion. It is therefore not a consolidated cash flow today and is carried at nothing. If exercised on the terms described, it would add capacity worth roughly a sixth of the current merchant base for a capital cost the parent has already largely borne. That is real value sitting outside the numbers in this study.

# 6. Reading the probability zones

The percentile table in section 3 is easy to misread, so here is what it does and does not say.

- The 50th percentile is not a forecast. It is the middle of a distribution, and the distribution is wide. Half of all outcomes fall on each side of it.
- The touch probabilities are higher than the ending probabilities, and that is not an error. A price can trade through a level during the period and come back; touching is easier than finishing.
- The bands come from the share's own volatility, not from the valuation. A share can be cheap on the analysis in section 1 and still spend three months falling. The two halves of this study answer different questions and are deliberately not reconciled.
- The bands widen with the square root of time, roughly. The three-month range is wider than the one-month range because more can happen, not because the outlook is worse.

# 7. Caveats and what would change our mind

| Concern | Why it matters | What would change the answer |
|---|---|---|
| **The pass-through rate rests on three observations** | It is the single most consequential number in the study and the sample is tiny. The physical cross-check and the accrual-stripped rerun both support it, but neither is a substitute for more data. | Two more reported half-years at different price levels. If the slope moves to 0.65 the value falls to AED 0.63; at 0.30 it rises to AED 3.07. |
| **The beta is weak** | The regression against the local market gives 0.931 but explains only 10.0% of the share's movement, with a 90% confidence interval from 0.47 to 1.40. The reason is economic, not statistical: this share is driven by global nitrogen prices, and the local index is mostly banks and property. | A beta of 1.0 rather than 0.93 would cut the cash-flow value materially. The sensitivity table in section 1.9 shows the range; a reader who believes the local index is the wrong yardstick should read the low end of the cash-flow range and weigh the enterprise multiple beside it, which needs no beta at all. |
| **The Algerian gas liability is unsettled** | $469 million accrued at 30 June 2026, retrospective to November 2023, with negotiations unconcluded and no payment schedule. The auditors treated it as a key audit matter. | The settled formula. If the final price is materially above what has been accrued, both the liability and the forward cost rate rise together. |

| Concern | Why it matters | What would change the answer |
| --- | --- | --- |
| **Two primary sources disagree** | The audited segment note describes limited gas price exposure; the chief executive describes product-linked pricing. The study follows the latter. | A clear statement in the next annual report. If the segment note wording proves the accurate one, the value is materially higher than shown here. |
| **The float is thin** | A 12.6% free float against an 87.4% state-owned parent. Price discovery is limited and the share can move on flow rather than fundamentals. | Nothing in the near term. It is a permanent feature to price, not an event to wait for. |
| **Terminal value dominates** | 56.3% of enterprise value sits beyond year five under framing A and 62.0% under framing B. That is normal for a long-lived asset base and still means most of the answer is an assumption. | The two-way sensitivity in section 1.9 is the honest map of that exposure. |
| **Third-party trading is not built bottom-up** | The company discloses traded volumes but never a purchase price, so this leg is carried at a segment margin rather than unit economics. | Disclosure of trading cost of goods sold. The leg is small — under a fifth of revenue and under a fiftieth of profit — so the gap is flagged rather than fatal. |

# Appendix A — Financial statements

## A.1 Income statement — three years reported, five years forecast

| US$ million | FY2023 | FY2024 | FY2025 | 2026E | 2027E | 2028E | 2029E | 2030E |
|---|---|---|---|---|---|---|---|---|
| Revenue | 2,416 | 2,009 | 2,827 | 3,770 | 3,267 | 3,095 | 3,121 | 3,164 |
| EBITDA | 989 | 629 | 1,025 | 1,334 | 1,105 | 1,017 | 1,016 | 1,024 |
| Depreciation and amortisation | 279 | 280 | 298 | 305 | 315 | 325 | 333 | 340 |
| EBIT | 710 | 349 | 727 | 1,029 | 790 | 692 | 683 | 684 |
| EBITDA margin | 40.9% | 31.3% | 36.2% | 35.4% | 33.8% | 32.8% | 32.6% | 32.4% |
| Net finance cost | -123 | -120 | -114 | | | | | |
| Profit before tax | 587 | 229 | 614 | | | | | |
| Profit for the year | 505 | 214 | 589 | | | | | |
| Attributable to owners | 349 | 160 | 434 | 637 | 488 | 434 | 434 | 438 |

*Reported years are taken line by line from the audited consolidated statements. Forecast years are framing A.*

## A.2 Balance sheet

| US$ million | FY2023 | FY2024 | FY2025 | H1 2026 |
|---|---|---|---|---|
| Property, plant and equipment | 2,700 | 2,597 | 2,499 | — |
| Inventories | 134 | 164 | 336 | 441 |
| Trade and other receivables | 314 | 291 | 493 | 543 |
| Cash and cash equivalents | 760 | 634 | 735 | 1,373 |
| Total assets | 4,626 | 4,411 | 4,950 | 5,642 |
| Trade and other payables | 327 | 481 | 820 | 958 |
| Gross interest-bearing debt | 1,665 | 1,682 | 1,741 | 1,994 |
| Net debt | 996 | 1,135 | 1,164 | 621 |
| Equity attributable to owners | 1,445 | 1,242 | 1,356 | — |
| Non-controlling interests | 425 | 296 | 443 | — |
| Total equity | 1,870 | 1,538 | 1,800 | 2,163 |

## A.3 Forecast balance sheet and cash flow markers

| US$ million | 2026E | 2027E | 2028E | 2029E | 2030E |
|---|---|---|---|---|---|
| Property, plant and equipment | 2,369 | 2,294 | 2,254 | 2,236 | 2,231 |
| Net working capital | 534 | 460 | 434 | 438 | 443 |
| Invested capital | 2,903 | 2,754 | 2,688 | 2,674 | 2,674 |
| Return on invested capital | 30.8% | 24.9% | 22.3% | 22.2% | 22.2% |
| Net debt | 503 | 257 | 104 | 3 | -84 |
| Capital expenditure | 175 | 240 | 285 | 315 | 335 |
| Free cash flow to the firm | 885 | 835 | 666 | 608 | 593 |

The working-capital cycle is projected from the cycle the company actually runs, not plugged. Receivable days, inventory days and payable days measured off the filed statements were 64, 63 and 82 respectively for 2025, the payable figure excluding the Algerian gas accrual because that is not a trade payable in the ordinary course. Including it would have shown a negative cash conversion cycle of 27 days and made the business look as though suppliers funded it; excluding it gives 45 days, which is the honest figure and the one used.

# Appendix B — Peers, risks and sources

## B.1 Comparable companies

| Company | Market | Enterprise value to EBITDA | Character |
|---|---|---|---|
| **Nutrien** | US | 7.4x | diversified nutrient, retail attached |
| **CF Industries** | US | 6.1x | pure nitrogen, Henry Hub advantaged |
| **Yara International** | NO | 5.2x | nitrogen, European gas cost |
| **OCI Global** | NL | 5.6x | nitrogen and methanol |
| **Industries Qatar** | QA | 9.1x | Gulf petrochemical and fertiliser |
| **SABIC Agri-Nutrients** | SA | 10.4x | Gulf nitrogen, Tadawul rating |

## B.2 Risk register

| Risk | Type | Assessment |
|---|---|---|
| **Nitrogen price cycle** | Market | The dominant exposure, partly self-hedged by the gas link |
| **Algerian gas contract settlement** | Contractual | Unquantified until agreed; accrued but not settled |
| **Egyptian gas supply** | Operational | Curtailments hit the second quarter of 2025; management reported no interruptions through the first half of 2026 |
| **Regional conflict and shipping routes** | Geopolitical | Directly affected export volumes and logistics cost in 2026 |
| **Country risk in Egypt and Algeria** | Sovereign | Priced explicitly through the asset-weighted equity risk premium |
| **Concentrated ownership and thin float** | Governance / liquidity | 87.4% held by one shareholder |
| **Currency** | Financial | Low — reporting, revenue and most debt are all in US dollars, and the dirham is pegged |

## B.3 Sources

The complete source record — every input with its value, date and derivation, grouped by research layer, together with the primary documents, the judgements and what would overturn each of them, and the searches that returned nothing — is published as a separate document accompanying this study. In summary:

| Category | Count | Detail |
|---|---|---|
| **Complete audited financial years obtained** | 4 | FY2022, FY2023, FY2024 and FY2025, each from the signed consolidated statements |
| **Interim periods of the current year** | 2 | First quarter and first half of 2026, both already on the public record and both incorporated before the forecast was built |
| **Company documents read** | 6+ | Audited statements, interim statements, management discussion and analysis reports, investor presentations and the results-call transcript |
| **Distinct inputs recorded** | 208 | Each with a value, a source, a date and a research layer |
| **Aggregator-sourced figures in the build** | 0 | Peer market multiples are used as a cross-check only and are labelled as such |

# Appendix C — Expert panel

Three analysts were asked to value the company by genuinely different methods. Each shows their workings, names the assumption their answer rests on, and states in advance what would prove them wrong.

## C.1 Expert 1 — the multiple

Worldview: a commodity producer is worth what the market pays for comparable cash flows. Discounted cash flow models of cyclical businesses are precision theatre; the multiple embeds what buyers actually believe.

When it works: at cycle midpoints, and where the peer set is genuinely comparable. When it fails: at cycle extremes, when every peer is mispriced together, and when the peer set differs in gas cost, country risk or capital structure — all three of which apply here to some degree.

| Line | Value |
|---|---|
| **Mid-cycle EBITDA (US$m)** | 1,191 |
| **Multiple applied** | 6.4x |
| **Enterprise value (US$m)** | 7,621 |
| **less net debt (US$m)** | -621 |
| **less non-controlling interests** | 26.3% of equity value |
| **Value per share (AED)** | **2.30** |

Named sensitivity: each half-turn on the multiple moves the value by roughly AED 0.20 per share. Falsifier stated in advance: if Gulf nitrogen peers de-rate below 7 times while Fertiglobe's own earnings hold, this method is reading a sector sentiment rather than a company value, and should be discounted.

## C.2 Expert 2 — the cash flow

Worldview: only the cash a business produces matters, and the job is to model the mechanism that produces it. For this company that mechanism is the link between selling price and gas cost, and any model that ignores it is valuing a different company.

When it works: where the operating mechanics are understood and documented. When it fails: when the discount rate is uncertain, which it badly is here — the beta explains only 10.0% of the share's movement.

| Line | Framing A | Framing B |
|---|---|---|
| **Present value of five years of cash flow (US$m)** | 2,680 | 3,341 |
| **Present value of terminal value (US$m)** | 3,459 | 5,463 |
| **Enterprise value (US$m)** | 6,140 | 8,804 |
| **Terminal share of enterprise value** | 56.3% | 62.0% |
| **Terminal return on capital (a diagnostic, not an input)** | 13.5% | 18.2% |
| **Capital maintenance charged in the terminal (US$m)** | 395 | 399 |
| **Value per share (AED)** | **1.81** | **2.68** |

Named sensitivity: moving the gas pass-through from 0.48 to 0.65 takes the value from AED 1.81 to AED 0.63. Falsifier stated in advance: if the company reports a half-year in which realised price falls sharply and cash cost per tonne does not follow it down, the pass-through relationship is not real and this valuation is wrong in both directions at once.

## C.3 Expert 3 — the assets

Worldview: in a commodity industry, price eventually returns to the cost of building new supply. What the existing plants would cost to replace is therefore the anchor, and earnings are the noise around it.

When it works: over long horizons, and where capacity is fungible and tradeable. When it fails: when existing assets carry something a new entrant cannot buy — which is exactly the case here, because the legacy Algerian and Egyptian gas contracts are not available to anyone building today. This method therefore understates.

| Line | Value |
|---|---|
| **Installed capacity (kt)** | 6,600 |
| **Replacement cost per tonne of capacity (US$)** | 1,250 |
| **Replacement enterprise value (US$m)** | 8,250 |
| **less net debt (US$m)** | -621 |
| **Value per share (AED)** | **2.50** |

Named sensitivity: a $250 change in replacement cost per tonne moves the value by about AED 0.54 per share. Falsifier stated in advance: a greenfield ammonia-urea complex announced anywhere in the Gulf at a materially different capital cost per tonne would reset this anchor immediately.

## C.4 Cross-examination

| Challenge | From | Response |
|---|---|---|
| **"Your multiple is borrowed from companies with different gas contracts and different country risk. It cannot be the anchor."** | Expert 2 to Expert 1 | Conceded in part. The multiple applied sits below the Gulf peers precisely for that reason, but the objection is right that the peer set is imperfect. |
| **"Two thirds of your value is a terminal number resting on a beta that explains six percent of anything."** | Expert 1 to Expert 2 | Conceded. This is the method's real weakness and the reason the study weights it at less than half rather than relying on it alone. |
| **"Replacement cost ignores that the whole business is a legacy gas contract ""wrapped in steel."** | Expert 2 to Expert 3 | Conceded, and stated by Expert 3 in advance. The method is a floor, not a valuation. |
| **"Your cash flow model assumes the pass-through holds when prices fall. It has only ever been observed while they rose."** | Expert 3 to Expert 2 | Rejected, with a caveat. The chief executive described the arrangement as symmetric, and a contract formula does not know which way the price is moving. But the observation is fair that it has not yet been tested downward, and it is recorded as the stated falsifier. |
| **"If the audited note is right and gas exposure really is limited, all three of you are too low."** | Expert 1 to all | Accepted as a live possibility and carried in the caveats. It is the single reading of the evidence under which this study is materially too conservative. |

## C.5 The three in one room

Put together, the three converge more than their methods suggest they should. Expert 1 lands at AED 2.30, Expert 2 at AED 1.81 on framing A, and Expert 3 at AED 2.50. The spread is about AED 0.69 per share, or roughly a eighth of the middle value — narrow, given that one counted cash flows, one counted comparable multiples and one counted steel.

They agree on the mechanism and disagree about its durability. All three accept that the gas link is real and that it caps the upside from a price spike. Expert 2 is willing to model five years of it; Expert 1 doubts anyone can; Expert 3 thinks it does not matter over a long enough horizon. Where they genuinely part company is the terminal value, and that is also where the study is least certain.

## C.6 Divergence table

| Assumption | Expert 1 | Expert 2 | Expert 3 | Drives how much of the gap? |
|---|---|---|---|---|
| **Mid-cycle EBITDA** | 1,191m | Modelled per year | Not used | Small — the levels are close |
| **Terminal treatment** | Multiple embeds it | 56.3% of value | Replacement cost is the terminal | Large — this is the main divergence |
| **Cost of capital** | Implicit in the multiple | 11.9% | Not used | Large — Expert 2 alone is exposed to the weak beta |
| **Gas pass-through** | Implicit | 0.48 explicit | Irrelevant | Moderate — all three are exposed, only one prices it |
| **Value of the legacy gas contracts** | Partly in the multiple | In the cash flows | Excluded by construction | Explains why Expert 3 is a floor |

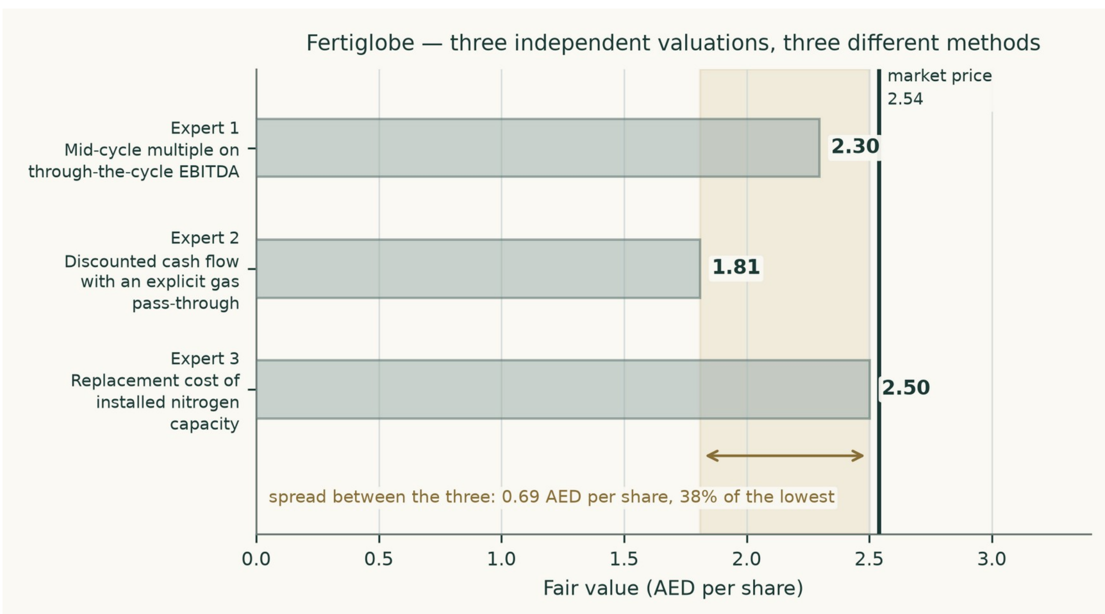

*Figure 8. The three expert valuations and their spread.*

## About

Testahil publishes independent valuation studies and calibrated probability ranges for listed securities, together with a public record of every forecast made and how it turned out. Studies are built from primary sources — the company's own issued financial statements and disclosures — and every figure in a study traces to a dated source in the accompanying source document.

Two things are published for every company: a fair-value range produced by four independent methods, and a probability distribution for the share price over defined horizons. They answer different questions and are not reconciled with one another. Neither is a rating and neither is a price target, because a single number implies a confidence that the evidence does not support.

Every probability range is tested against the security's own price history before it is published, scored against a benchmark that already includes the time value of money, and reported honestly whether it beat that benchmark or not. In this study it did not beat it, and section 3 says so.

## Disclosure

This document is educational analysis. It is not investment advice, an offer, a solicitation, or a recommendation to buy or sell any security. It contains no rating and no price target.

The analysis rests on public information believed to be reliable, principally the company's own audited and interim financial statements, management commentary, investor presentations and results-call transcript, together with published sovereign risk data and market prices. No representation is made that it is complete or free of error. Forward-looking figures are estimates and will differ, possibly materially, from what actually happens.

Valuation involves judgement. Reasonable analysts using the same public information will reach different conclusions, and this study makes the largest of its own judgements visible and computes the most consequential one two ways rather than one. Readers should form their own view and, where appropriate, take professional advice.

Price basis 2026-08-07. Study date 2026-09-04. Currency: figures in US dollars unless marked AED; per-share values converted at 3.6725 dirhams to the dollar.
