# Testahil — ADNOC Logistics & Services plc (ADX: ADNOCLS)

Companion model · Independent Valuation Study · Educational analysis · Not investment advice

What this workbook is. A transparent companion to the ADNOC L&S valuation study. Every blue cell is an input; every black cell is a formula; green cells link across sheets.

IT IS FORMULA-DRIVEN. Every figure that can be derived arithmetically from a driver is a live formula, s you can change a blue cell on Assumptions and watch the model reprice. The cost of equity is built from th normalised risk-free rate, the beta and the equity risk premium — and the normalised rate is itself a formula, the observed government bond yield less the sovereign default spread. The cost of debt is built three separate ways on the sheet — the parent facility at the overnight financing rate plus its margin, a weighted blend of the instruments the company actually has outstanding, and the disclosed third-party bank-loan midpoint — and the three are averaged in a cell. The discount factors compound year on year of the cost-of-capital glide, with a three-quarter stub for 2026 because the valuation date is 31 March 2026. The tanker fleet is built vessel by vessel from the vessel counts and day rates on Assumptions; the balance sheet rolls property, plant and equipment, working capital, equity and net debt forward; and every ratio ar per-share figure, including the conversion to dirhams at the fixed parity, is a formula.

ONLY THREE KINDS OF CELL ARE PASTED VALUES, and it is worth knowing exactly which. Anything el would be a defect, and the build script carries a sheet-by-sheet register of every pasted cell against these three so the claim can be checked rather than taken on trust.

(1) DISCLOSED HISTORY AND GENUINE INDEPENDENT INPUTS — the blue cells: the audited stateme operating-segments note, disclosed vessel counts and day rates, the twelve charter fixtures and their dates, the eleven vessels bought on 7 August 2026 and their delivery dates, the balance-sheet anchors the tax rates, the peer multiples with their sources and dates, and the study judgements. Where a line is both disclosed and derivable the DISCLOSED figure is carried, because the filing is the record — but only ONCE: the same audited figure is never typed in two places, so group revenue is added up from the segment note, the audited net debt is gross borrowings less cash, and the intangibles and goodwill on the driver sheet point at the balance sheet. Anything on the Assumptions sheet that is itself DERIVED is a GREEN formula pointing at the build that produces it — the running cost per vessel-day, the gas-carrier day rate, the reported and re-based receivable days, both gross-up factors, the opening working capital and the vessel-years the August purchase adds.

(2) THE OUTPUT OF A UNIT BUILD that would be unreadable flattened into a grid. No cell in this workb now rests on that justification: the block that used to — the historical segment table — is the disclosed operating-segments note, which is category (1).

(3) WHOLE-MODEL RE-RUNS, where each figure is a complete revaluation of the entire model and so ca a single formula: the Monte Carlo price map, the three sensitivity grids, the discounted-cash-flow bear and bull bounds (each of which re-runs the fleet build at a different rate anchor, a different beta — the two ends of the regression's own confidence interval — and a different capital-expenditure path) and the three expert-panel legs.

THE MONTE CARLO AND SENSITIVITY GRIDS DO NOT REDRAW WHEN A DRIVER IS CHANGED. Cha reprices the whole valuation chain, but those grids are engine outputs and stay as they were run.

WHAT CHANGED IN THIS EDITION. On 7 August 2026 — the anchor date of this study — the company ar purchase of eleven vessels for about USD 1.3 billion: six very large crude carriers and three gas carriers bought secondhand for third-quarter delivery, and two gas carrier newbuildings for the fourth. That price inside the market price this valuation is compared against, so it is now in the model: the crude carriers earn at the implied spot rate from their delivery date, the gas carriers add contracted vessel-years, and the USD 1.3 billion is carried BOTH in net debt, because the purchase is committed and funded, and in the opening asset base, where it depreciates and shields tax. The smallest tankers are no longer priced at the medium-range rate unadjusted — the company disclosed handysize rates down 21% against medium range so the substitution had the sign wrong and the rate is now scaled by that disclosed move. Receivable days are re-based onto the revenue basis the forecast actually uses rather than carried across from a year with different gross-up, and the arithmetic of that re-basing is on the Assumptions sheet in cells. The cost of debt is labelled for what it is — an average of three constructions, with the one genuinely weighted by the instruments outstanding shown beside it rather than the average being called weighted. The depreciation used, the rate the company realised in 2025 and the disclosed useful lives now sit together so the choice can be judged. And the earnings multiple is shown on BOTH bases, forward and trailing, for the peers and the company, because an earlier edition compared the company trailing against peers shown forward.

AND THE BETA HAS BEEN RE-MEASURED. It is now produced by the same standard routine used for eve covered on this desk: the market series is resolved from the exchange the share is listed on rather than chosen, both series are screened for data quality before they are paired, and the weekly returns are measured on that exchange's own trading week. The series it resolved is the one this study already used, s WHICH market the share is measured against has not changed — but the grid and the screening do move figure: the slope is now 1.1032 on 159 weekly observations, and its 90% confidence interval runs 0.586 to 1.621, materially WIDER than the interval the previous edition published. The bear and bull cases take those two bounds directly, so the published range widens with it. A range that widens on re-measurement is information about how much a three-year price history can sett not an embarrassment to be smoothed away.

How revenue is built. Not as one growth rate, and not off the published rate either. The company gives one rate per vessel class each quarter, and its own chief financial officer said on the first-quarter call that this rate is a BLEND across the whole class, the vessels on charters out included. So the SPOT rate is not read off that disclosure — it is SOLVED out of it, window by window: the published blend times the class vessel-days, less the revenue the twelve disclosed fixtures earn over exactly the days their own contracts run, divided by the vessel-days that actually traded spot. Every step of that derivation is on the Segments sheet, cell by cell. The forecast then prices each vessel on its own terms — chartered vessels at their contracted rate for their contracted days, everything else at the implied spot rate — less an all-in running cost per vessel-day that is itself solved so the same construction reproduces the tanker earnings the comp reported for 2025. The gas carriers are contracted vessel-years times a day rate solved the same way. The five remaining units are grown on their own revenue and margin drivers, anchored on what each actually earned in the first quarter of 2026.

THE COST OF CAPITAL CARRIES THREE TRANCHES, NOT TWO: equity, debt, and the perpetual capital their own coupon. Those securities rank ahead of the ordinary shares and are deducted in the equity bridg and a claim that is deducted from enterprise value has to be weighted in the rate as well — the two are halves of one treatment. The coupon is an equity distribution rather than interest, so it is not taxed down. Every construction in the workbook carries the same three tranches, including the sensitivity re-runs, so the sensitivity grid is centred on the figure it brackets.

THE BOOK LENS IS A RESIDUAL INCOME BUILD. A single-stage justified price-to-book assumes a steady company is not in: it pays out about a third of its earnings and compounds its book above its own cost of equity, where that formula is undefined rather than merely wrong. The lens is instead the book the compa already has, plus the present value of earning more than the cost of equity on it for five years, plus a remainder in which that excess fades. The whole ladder is live on the Relative & Normalized sheet, three times over — base, bear and bull — and the return it is struck on is what the ORDINARY holders earn, afte the perpetual coupon that ranks ahead of them.

THE CONTESTED JUDGEMENT, PUBLISHED BOTH WAYS — HOW THE MARKET IS MEASURED. The sa stock's own returns is run against two different measures of its market, and the answer moves a long way between them. Against the published index of the exchange the share is listed on — the index the method asks for, and the primary reading — the beta is 1.103. Against an equal-weight composite of that same exchange's names, which gives its smallest listings the same say as its largest, the beta is 0.705. The published index is weighted by size and is therefore dominated by the very group this company belongs to; the composite is not. That single difference in construction, and nothing about the company, moves the cost of equity and the cash-flow value materially. BOTH are carried through the mode full, side by side, on the Summary, Fundamental Valuation and DCF sheets. They are NOT averaged into o number. The regression's own 90% confidence interval on the primary estimate runs 0.586 to 1.621, and those two bounds — not round numbers chosen by hand — are the betas used in the bear and bull cases, s published range is the range the estimate itself supports.

What it is not. It is not investment advice, a recommendation, or a price target. Values are model outputs shown as ranges and distributions.

Sourcing note, up front. FY2023, FY2024 and FY2025 come from the company's own audited consolidated financial statements; the first quarter of 2026 comes from the reviewed interim statements; the fleet, rate and contract data come from the company's own investor presentations and earnings calls. Every inpu is listed with its value, source and date in the companion bibliography document.

Currency. US dollar thousand unless stated — the company reports in US dollars. Per-share figures are in dirhams at the fixed parity of 3.6725 dirhams to the dollar. Spot AED 6.16 (2026-08-07 close).

and is the primary reading. The equal-weight composite is what an earlier construction of this study use ed, and it is kept in view because a difference of this size is a property of index construction rather than a a fact about the company. The regression passes its usability gate, but the history is only three years lon g and the 90% interval shown above spans more than half the point estimate, so the alternative is not a s stress case — it is a second legitimate answer to the same question.

## Assumptions — every input in the model

Blue cells are inputs. Change one and the model reprices: everything downstream is a formula

### Market and share anchors

Share price (AED, Abu Dhabi Securities Exchange close)
Shares outstanding (mn)
Dirhams per US dollar (fixed parity, unchanged since 1997)
Stub year fraction — 31 March 2026 valuation date to 31 December 2026
First-quarter 2026 free cash flow, already inside net debt at the valuation dat

### Cost of capital

Observed government bond yield (dirham tranche maturing January 2031)
Sovereign default spread (netted out of the risk-free rate)
Beta — own-stock weekly regression against the published index of its own ex
Beta — the same regression against an equal-weight composite of that exchar
Beta — lower bound of the regression's 90% confidence interval (the bull-case
Beta — upper bound of the regression's 90% confidence interval (the bear-cas
Beta — the measured slope shrunk toward the market: two-thirds of it plus or
Equity risk premium (mature premium plus country risk)
Terminal risk-free rate
Statutory corporate tax rate

### Cost of debt — the evidence behind the three constructions

Secured overnight financing rate
Parent revolving credit facility margin
Third-party bank loans — low end of the disclosed range
Third-party bank loans — high end of the disclosed range
Other third-party borrowings — low end of the disclosed range
Other third-party borrowings — high end of the disclosed range
Lease interest charged in 2025 (USD 000)
Lease liabilities, opening balance 2025 (USD 000)
Lease liabilities, closing balance 2025 (USD 000)
Shareholder loan at 31 March 2026 (USD 000)
Third-party borrowings at 31 March 2026 (USD 000)
Lease liabilities at 31 March 2026 (USD 000)

### Tanker fleet — vessel counts by class

Vessels owned at 31 December 2025
Less vessels sold between the year end and the valuation date

### Tanker rates — the published blended rate by class and quarter (USD

hat it cannot change the valuation, and an earlier edition of this workbook said so wrongly. It reaches th ne valuation through the balance sheet: receivable days are measured on reported revenue, so the gross-

-up sets the revenue base those days are re-based onto, and through the change in working capital it rea ches free cash flow. The re-basing is built in cells on the Assumptions sheet.

## Relative multiples, normalised earnings power and the book

USD thousand unless stated. Per-share figures in dirhams.

### Relative lens

FY2026E group EBITDA
Blended enterprise multiple
Implied enterprise value
Plus joint ventures and associates at carrying value
Less net debt at 31 March 2026
Less deferred consideration on acquisitions
Less the eleven vessels bought on 7 August 2026, at the announced price
Less perpetual capital securities at carrying value
Implied equity value before the minorities
Less non-controlling interests — the contracted slice at its contracted price, t
Implied equity attributable to ordinary shareholders
Value per share on the enterprise multiple (AED)
Blended FORWARD price/earnings — applied to forward earnings below, so t
FY2026E earnings attributable to ordinary shareholders
Value per share on the earnings multiple (AED)
Weight on the enterprise multiple

blished index of the exchange is what the method asks for and is the primary reading — it is weighted e count.

l by size, and is therefore dominated by the same large-capitalisation group this company belongs to. Th e equal-weight composite gives the exchange's smallest names the same say as its largest and is the con struction an earlier version of this study used; it is published beside the primary reading because a gap of this size is a fact about how the index is built, not about the company, and the reader is entitled to se e it. The gap between the two is the single most consequential judgement in this study.

and the two 2025 acquisition items — are not projected, because the forecast is built at the business-unit level on earnings before depreciation rather than on a cost-line split the filings do not support forward.

The finance charge is computed on gross borrowings, which move with the net-debt roll, so profit is stru ıck after interest and differs from the pre-financing discounted-cash-flow waterfall by construction.

## Balance sheet — condensed, and the rolls that drive it

USD thousand, consolidated. Every FY2023-25 line is the audited closing figure; every forecast line

| USD 000 | FY2023 |
|---|---|
| Property, plant and equipment | 3,806,543 |
| Right-of-use assets | 148,146 |
| Intangible assets | 11,440 |
| Goodwill | 51,368 |
| Investment properties | 95,269 |
| Investments in joint ventures and associates | 76,712 |
| Inventories | 120,720 |
| Trade and other receivables, including amounts due from related | 1,131,167 |
| Cash and cash equivalents | 215,709 |
| **Total assets** | **5,745,668** |
| Trade and other payables, including amounts due to related parti | 962,048 |
| Net working capital | 289,839 |
| Gross borrowings | 289,554 |
| **Net debt** | **73,845** |
