Weight	How it is built
25.0%	*Five explicit years of free cash flow to the firm, discounted on a glide from the current to the terminal cost of capital, plus a terminal value on the growth-over-return reinvestment identity.*
25.0%	*The identical model with the single contested judgement resolved the other way. Published beside Frame A, never averaged into it.*
20.0%	*Book value per share multiplied by (sustainable return less growth) over (perpetual cost of equity less growth).*
15.0%	*Three multiples triangulated ON the sheet — the multiple this model's own economics justify, the company's own four-year mean, and a cost-of-equity-adjusted regional peer median — averaged rather than asserted.*
15.0%	*The three-year average operating margin applied to forecast revenue, capitalised at the perpetual cost of equity on the payout that the growth rate permits.*
100.0%	*The weights sum to one; the cell to the left proves it.*
