Modon Holding PSC

ADX: MODON · Abu Dhabi Securities Exchange · United Arab Emirates dirham (AED)

Independent valuation study · revision 4 · 10 August 2026 · valuation date 30 June 2026 · price anchor AED 2.83 (close 7 August 2026)

READ FIRST. This study is an independent, educational analysis of Modon Holding PSC. It is not investment advice, not a recommendation, and it contains no price target. Every value is a model output presented as a range with its assumptions shown.

Revision 4. THE ANSWER IS NOW ONE LENS RATHER THAN AN AVERAGE OF FOUR, and nothing in the forecast moved to do it. Earlier editions published a weighted blend of four lenses at AED 2.50; this one publishes the cash-flow model itself, at AED 3.54, with the asset value, the relative multiple and the book floor beside it as cross-checks. Two things follow and both are stated rather than left to be noticed. The direction of the disagreement with the market REVERSES — the blend read -12% against the price and the cash-flow lens reads +25% — and the float-and-governance friction that those weights were carrying, worth 30% of the cash-flow lens, is no longer priced anywhere in the answer. Section 1.5 says so plainly and leaves the question open rather than settling it inside a set of weights. The normalised-earnings lens is removed rather than re-weighted: a developer recognising revenue against completion reports earnings that are an accident of which project completed in which year.

Revision 3. One input changed and it changed the verdict. Revisions 1 and 2 could not obtain the exchange's official index and measured the stock's market sensitivity against a composite built from this study's own price library, flagged in both editions as a stand-in. The official FTSE ADX General series has since been obtained, and the regression is now run against it on the house method — including the correction for thin trading that a stock with 84.75% of its shares in one pair of hands requires, and which a plain regression understates. Beta goes from 1.03 to 1.75 and the cost of equity from 9.08% to 12.56%; on the blend this study published at the time that took the answer from AED 3.38 to AED 2.50. Nothing in the forecast moved: not a revenue line, not a margin, not the backlog. The stand-in flattered the company and the correction is reported here rather than absorbed quietly. Beta is the input this valuation is most exposed to, and its 90% range (1.09-2.40) is wide; section 1.9 prices it.

Revision 2. The first edition (earlier the same day) struck its development drivers on 31-December-2025 disclosures although the company's H1-2026 results release of 29 July 2026 — which this study cites for other figures — had superseded them: the revenue backlog had reached AED 65.4 billion (95% development) and H1 sales AED 26 billion. External audits caught that failure and several others. This edition restrikes the valuation on the 30-June-2026 reviewed balance sheet, rebuilds working capital from components, charges depreciation on the asset base, derives the terminal capital structure from the model's own forecast, bridges on available rather than gross cash, replaces the assumed beta with a regression, and rebuilds the peer table on one attributable basis from the peers' own filings. Each change is marked where it appears.

Sources. Every historical figure comes from the company's own audited statements, reviewed interims and results announcements. Peer figures are cross-checks, labelled. The companion bibliography lists every input with value, source and date.

The one judgement that matters most. Whether the realised 2025–26 development surge normalises-but-sustains (base) or collapses to run-off (now a stress case — the H1 disclosure falsified it as a live central path) moves this valuation more than any other input. Both readings are computed in full and shown side by side, never averaged.

Headline

Fair value AED 2.64–4.13 per share — the cash-flow lens under the run-off and growth-hold paths of the same model, not a distribution and not a spread across methods — with a central of AED 3.54 against a market price of AED 2.83 (+25%).

Modon Holding is Abu Dhabi's government-owned city-builder: real-estate development (Hudayriyat Island, Reem Island, Ras El Hekma in Egypt), the ADNEC events platform, a hospitality portfolio and an asset-management leg. The first half of 2026 was the strongest in its history: revenue AED 9.2bn (+40%), profit AED 2.2bn, real-estate sales AED 26.0bn in six months (a single Hudayriyat launch took AED 13bn within days), and a revenue backlog of AED 65.4bn — double a year earlier, 95% of it contracted development.

The cash-flow reading of that backlog is worth AED 3.54 per share on the base path, and AED 2.64 even if launches halve and fade (the run-off stress). The market lenses sit lower: the peer multiple implies about AED 2.20, normalised mid-cycle earnings about AED 1.46, and book value at a justified multiple about AED 1.74. The market prices Modon at 11.5x trailing attributable earnings against 8.1x for Aldar on the same basis. Section 4 prices the gap; section 1.7 shows both sales paths in full.

Over the next three months the price map is symmetric and modest: central band AED 2.64–3.09, 5th–95th percentiles AED 2.32–3.52. A fundamental verdict of this size, if right, plays out over years, not a quarter.

Valuation summary

Lens	Bear	Base	Bull	Role	vs price
Discounted cash flow (the answer)	2.64	3.54	4.13	THE ANSWER	+25%
Asset net asset value		4.06		cross-check	+43%
Relative multiples	1.38	2.20	2.37	cross-check	-22%
Normalised earnings power	1.03	1.46	1.80	not published for this class	-48%
Book value & sustainable return	**1.04**	**1.74**	**2.43**	**a floor, never weighted**	**-39%**
THE CENTRAL — the cash-flow lens, not an average	2.64	3.54	4.13	the class primary	+25%
NOT AVERAGED — the retired blend, published unused		2.50		retired	-12%
DCF terminal value share of enterprise value: 68.7%					
Market price (7 Aug 2026)		2.83			

AED per share. The DCF bear is the run-off stress and the bull the growth-hold scenario of section 1.7 — engine re-runs whose full driver vectors are published on the model's Assumptions sheet. The bear–bull row on the central line is the envelope of lens extremes, labelled as such. The terminal value share is stated beside the lens it belongs to and linked live in the Excel bridge.

The contested judgement, both ways: base path AED 3.54 · run-off stress AED 2.64. Same balance sheet, different sales paths; never averaged. The realised H1-2026 sales of AED 26bn falsified the run-off as a central scenario — it is retained as the stress bound.

Company overview

Modon Holding PSC is the Abu Dhabi government's listed city-development platform. The listed vehicle began as Al Qudra Holding, became Q Holding, and in 2024 absorbed Modon Properties and the ADNEC Group in a share-financed combination that multiplied the balance sheet roughly four-fold and reset the perimeter — FY2024 income carries a AED 9.2bn accounting gain from that combination and is treated as a transition year throughout. On 30 October 2025 IHC and ADQ sold their entire stakes to L'imad Holding Company PJSC, wholly owned by the Abu Dhabi Government — 84.75% of the shares (the arithmetic of the disclosed share count; one company announcement rounds it to 84.76%). The stock trades on ADX's growth market with a correspondingly thin free float.

Four reported segments. Real Estate Development (54% of FY2025 revenue) masterplans and sells land and homes on Hudayriyat Island (>50mn sqm, 40,000 planned units), Reem Island and Al Ain, and leads phase 1 of Ras El Hekma on Egypt's north coast (170.8mn sqm, 500,000+ planned units), alongside La Zagaleta in Spain. Events, Catering & Tourism (36%) is the ADNEC platform: venues in Abu Dhabi and London (ExCeL), event infrastructure (Arena Group), catering and tourism. Hospitality (6%) reported 7,137 keys across 27 hotels including managed properties at end-2025; the H1-2026 release counts 3,613 keys across 16 owned, operated and JV hotels — the narrower perimeter this study's forward driver uses, with the difference (managed-for-others keys) stated. Asset & Investment Management (5%) holds the recurring-income portfolio (96–97% occupancy) and financial investments including 50% of 2 Finsbury Avenue in London. Recurring revenues reached 38% of the group in H1-2026.

Segment	Revenue	Gross profit	Margin	Profit before tax	Assets
Real Estate Development	7,403	3,233	43.7%	2,548	55,739
Asset & Investment Mgmt	655	421	64.3%	685	11,096
Hospitality	792	211	26.6%	-69	4,602
Events, Catering & Tourism	5,009	1,325	26.5%	1,062	14,118
Group (incl. others/eliminations)	**13,829**	**5,025**	**36.3%**	**4,421**	**87,031**

FY2025 segments, AED mn, audited. Hospitality's pre-tax loss reflects financing and depreciation on a young portfolio; its gross profit is positive.

1 · Fundamental valuation

1.1 · Cash-flow model — restruck at 30 June 2026

The model values the company from its 30-June-2026 reviewed balance sheet: a half-year 2026 stub, then four full years, then the terminal block. Development revenue converts the disclosed AED 62.1bn development backlog (65.4bn × 95%) at a visible conversion rate anchored to the pace actually recognised in H1 (development revenue ex-land of AED 4.2bn on an opening 42.6bn backlog, ~20% annualised); new launches roll the backlog forward. The other legs are anchored on their H1 actuals with the events-heavy second-half seasonality stated. Fair-value gains, bargain and disposal gains are zero across the forecast by construction.

Working capital is built from components, calibrated at the two balance-sheet dates (31-Dec-2025 and 30-Jun-2026): receivable days on revenue (440 days at both anchors — the related-party collection question in one number), a land-bank roll (new project WIP added per dirham of sales, cost of sales drawn from the existing at-cost bank), and payables-plus-advances cover of direct costs (2.6× at end-2025, 1.86× at 30-Jun-2026, declining — presale advances, not the balance sheet, fund construction). The result is absorption while growth is hot — matching the AED 3.9bn operating outflow the H1 statements actually show — and releases only late, as collections and the land bank catch up. The first edition assumed schedule-based releases; the audits were right to attack it.

AED mn	H2-26E	FY27E	FY28E	FY29E	FY30E
Revenue	11,046	26,019	32,007	34,928	36,189
Gross profit	4,165	9,619	11,784	12,807	13,143
General & administrative	-917	-2,290	-2,785	-3,004	-3,076
Selling & marketing	-188	-468	-544	-594	-579
Investment and other income	80	165	170	175	180
EBIT	**3,140**	**7,026**	**8,625**	**9,384**	**9,668**
EBITDA margin	31.5%	29.7%	29.2%	29.1%	28.9%
Depreciation & amortisation (asset-base)	341	709	736	765	794
EBITDA	3,481	7,734	9,361	10,149	10,462
NOPAT = EBIT × (1 − 15.5%)	2,653	5,937	7,288	7,930	8,170
+ D&A	341	709	736	765	794
− capital expenditure	-700	-1,500	-1,550	-1,600	-1,650
− Δ working capital (components)	938	3,119	1,520	-313	-2,109
Free cash flow to firm	**1,357**	**2,027**	**4,955**	**7,408**	**9,423**
Discount factor	0.9483	0.8529	0.7671	0.6899	0.6205
PV of FCFF	1,287	1,729	3,801	5,111	5,847

H2-2026E is a half-year stub discounted at 0.5 years; FY2027E–FY2030E at 1.5–4.5 years. Explicit present value AED 17,773mn at the 11.19% cost of capital of section 1.8. The Δ-working-capital row ABSORBS cash through FY2028 — the reversal of the first edition's release schedule.

Working-capital components (AED mn)	H2-26E	FY27E	FY28E	FY29E	FY30E
Receivables incl. related-party (days × revenue)	24,392	30,653	35,953	37,320	36,684
Inventories + development WIP (roll)	34,435	35,239	34,923	33,972	32,687
Payables incl. advances (cover × costs)	23,935	27,881	31,346	32,075	32,263
Net working capital	34,892	38,010	39,530	39,217	37,108
Δ working capital (+ = absorption)	**938**	**3,119**	**1,520**	**-313**	**-2,109**

Terminal block. Terminal growth 2.5%; terminal return on capital 8.5% — deliberately below the model's own forecast path (which reaches ~13% by FY2030E as capital releases while profit grows) and above the FY2025 clean achieved 6.1%, a stated mean-reversion margin of safety. Reinvestment = g/ROIC = 29.4%, derived. The terminal debt weight is no longer assumed: it is DERIVED from the model's own FY2030E balance sheet (8.0%), which puts the terminal rate at 11.92% — ABOVE the explicit-window rate, where the first edition had it below. Terminal value AED 62,758mn, worth AED 38,939mn today — 68.7% of enterprise value, a share the reader should see and judge; the working-capital absorption in the explicit years pushes it up, and section 1.9 prices the terminal-return case both ways.

Enterprise value → equity per share (30-Jun-2026)	AED mn
PV of explicit periods	17,773
PV of terminal value	38,939
Enterprise value	**56,712**
of which terminal value: 68.7%	
+ unrestricted (available) cash — disclosed	8,600
(excluded: AED 3,703mn of escrow/restricted cash — it funds completion of the very backlog the DCF values; adding it back would double-count)	
− debt incl. the related-party loan	-9,542
− lease liabilities	-645
+ associates & joint ventures at book	2,826
+ financial assets	393
− non-controlling interests, capitalised at 2% of equity value (book AED 922mn shown as the alternative)	-1,148
Equity attributable, 30 Jun 2026	**57,197**
Per share (16,347mn shares)	3.50
Rolled 38 days to the 7 Aug 2026 anchor at the cost of equity	**3.54**

Gross-cash alternative (first edition's basis): AED 3.77; book-NCI alternative: AED 3.56. Both are shown in the workbook. On the strict all-cash basis the company holds net cash of AED 2,762mn; on its own available-cash definition it reports net debt of AED 912mn — both framings stated.

1.2 · Book value and sustainable return

Attributable equity at 30 June 2026 is AED 56,397mn — AED 3.45 per share, so the market pays 0.82x book. One cleaning, tied to the disclosed line items: FY2025 carried AED 735mn of fair-value and disposal gains; removing them (tax-effected) puts clean attributable return on average equity at 6.6% against 7.8% reported. The 7.5% used here is a forward-sustainable judgement, not that cleaning: it sits between the mechanical clean figure and the model's own forecast path (10.3% rising), and the first edition's conflation of the two — flagged by the audits — is withdrawn. Justified price-to-book = (7.5% − 2.5%) / (12.56% − 2.5%) = 0.50x, worth AED 1.74 per share rolled to the anchor — this lens is now struck on the same date as the others.

1.3 · Relative multiples — rebuilt on one basis

Peer	Spot	Mkt cap, AED mn	FY2025 attributable NP	Trailing P/E (attr.)	Backlog (own disclosure)
Aldar Properties (ADX)	7.78	61,171	7,548	8.10x	71,700
Emaar Properties (DFM)	11.50	101,650	17,599	5.78x	155,000
Emaar Development (DFM)	13.38	53,520	11,316	4.73x	125,200
Modon Holding	**2.83**	**46,262**	**4,020**	**11.51x**	**65,400**

One basis throughout: attributable profit from each peer's own audited filings and releases; every multiple is the printed market cap over the printed profit (the first edition's table mixed bases and vintages and did not reconcile — rebuilt after the audits). Backlogs: Aldar FY2025 development 71.7bn; Emaar group 155bn; Emaar Development 125.2bn; Modon 30-Jun-2026 group 65.4bn — own disclosure and date per row. On the group-profit basis Modon's trailing multiple is 11.8x (dual-framed; FY2025 NCI was a loss, so attributable exceeds group profit).

The attributable peer set runs 4.7–8.1x trailing. This study applies 7.5x to FY2026E attributable profit (H1 actual plus the H2 model, AED 4,785mn) — parity-minus with the sector leader: the growth and recurring-income premium and the ~15%-float/related-party discount are treated as offsetting, and a forward multiple on a growing base is worth ~8% more than the same trailing multiple, stated. That gives AED 2.20 per share. The EV/EBITDA cross-check (7.0x, a house multiple with no computable peer anchor — peer net debt is not disclosed in reachable form) implies AED 2.82 and is displayed in the workbook but NOT averaged into the lens; the first edition's silent blend of two legs 43% apart is withdrawn.

1.4 · Normalised earnings power

Through a full cycle this study assumes development sales settle near AED 20.0bn a year — raised from the first edition's 18bn because the realised H1-2026 (AED 26bn in six months) lifts any honest cycle average, yet still far below the current pace — with the recurring legs grown moderately: normalised revenue about AED 24.4bn, through-cycle net margin 11.5%, normalised earnings AED 2,809mn (AED 0.172/share), worth AED 1.46 at 8.5x. The harshest lens: it treats 2025–26 as a cycle top.

1.5 · Synthesis — one lens is the answer, the others sit beside it

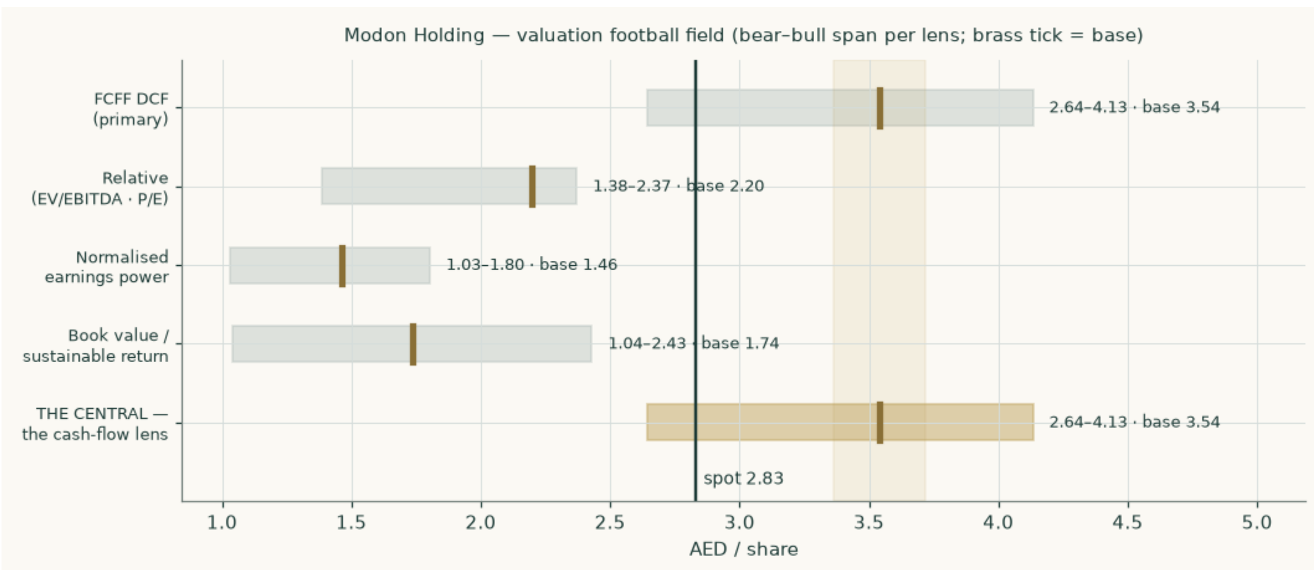

Figure 1 — the lenses against the market price. The cash-flow span is the run-off-stress-to-growth-hold spread of the same model.

The cash-flow lens IS the answer, at AED 3.54, +25% against the market. The asset net asset value at AED 4.06, the relative multiple at AED 2.20 and book value at AED 1.74 are published beside it as cross-checks — the last of those a floor rather than a value — and none of them is averaged into it. They straddle the answer, which is information a single blended number destroys.

A previous edition published a weighted blend of four lenses at AED 2.50 instead. That is shown above, unused, because the change matters and hiding it would be worse than making it: the blend read -12% against the market where the cash-flow lens reads +25%, so it reversed the direction of this study's disagreement with the price, and it landed below the run-off stress path at AED 2.64 that section 1.7 records as falsified by the first-half disclosure.

ONE CONSEQUENCE IS STATED RATHER THAN LEFT TO BE NOTICED. Those weights were not only a view about method: they were also how this study priced the float and governance friction that comes with a 22% free float and a dominant sovereign shareholder, and they cost 30% of the cash-flow lens in doing it. With the blend gone that friction is NOT priced anywhere in the figure above. Whether an explicit discount belongs, and how large, is a judgement this edition does not make — it is left open, to be published as a contested judgement with both framings valued, rather than buried in a set of weights where a reader would have to reverse-engineer it before they could disagree with it.

1.6 · Drivers — each leg on its own driver

Leg	Driver build	Path
Development	conversion of the disclosed 30-Jun backlog (10.5% half-year stub, then 25%→32%) + land sales; new sales AED 30.0bn→21.0bn/yr — every year below the realised H1 annualised pace	revenue AED 18.3bn→27.3bn
margin	41.0%→38.0% (H1 actual 41.3%); related-party land mix fades; construction escalator ~4% vs realised-price ~2%	output
Asset & investment mgmt	H1 actual + contracted occupancy (96%); ~8.5%/yr	AED 813→1,029mn
Hospitality	H1 actual + winter seasonality on the 3,613 owned/operated/JV keys; margin recovering to 30%	AED 899→1,081mn
Events, catering & tourism	H1 actual + the H2-weighted events season; ~4%/yr	AED 6.0bn→6.8bn
Working capital	receivable days 440→370; land-bank draw vs new-WIP add; advances cover 1.86×→1.40×	absorbs, then releases late
D&A	3.4% on the average depreciable base (asset-base charge — the first edition's revenue-driven D&A is withdrawn)	from the base roll
Tax	DMTT floor + foreign uplift (H1 actual 15.4%)	15.5%

Per-project volumes and prices are not disclosed; the build stops at segment level with unit-level anchors (FY2025: AED 7.0mn/unit realised in Abu Dhabi, 3.1mn internationally — the latter including joint-venture sales, so per-unit division across categories is not closed). That gap is flagged, not papered over.

1.7 · The crux — the sales path, priced both ways

	Base: normalising-but-sustained	Stress: backlog run-off
New development sales	H2-26 AED 12.0bn, then 30.0→21.0bn/yr	H2-26 AED 8.0bn, then 15.0→8.0bn/yr
Development margin	41.0%→38.0%	40.0%→35.0%
FY2030E group revenue	AED 36.2bn	AED 25.4bn
Value per share	**AED 3.54**	**AED 2.64**
Status	central path	stress bound: the disclosed H1-2026 sales (AED 26bn in six months, 2.6× prior year) falsify this as a live central scenario; it prices the question "what if that was the top?"

Even the stress reading values the group -7% against the market price; the growth-hold upper reading (sales held near the realised pace) reaches AED 4.13. All three driver vectors are published in the workbook.

1.8 · Macro and country — the cost of capital, built and priced

Rates are sourced and each risk charged once. The AED government curve gives 4.48% (January-2031 dirham treasury tranche, auctioned July 2026 ~4bp over US Treasuries; the longest liquid AED tenor, ~4.4 years against a perpetual stream — a limitation, stated); netting the UAE's own 0.42% default spread — which already sits inside the equity premium — leaves 4.06%. The equity premium is 4.87% on the rating basis (no sovereign CDS series exists for the UAE, so no CDS-basis alternative can be built; and the spread-basis mix in the first edition — rating-based for the netting, market-based for retiring the conflict premium — is now stated: on a like-for-like basis the two constructions differ by ~6bp).

Beta is measured against the exchange's own published index. Earlier editions could not obtain the FTSE ADX General series and used a composite of this study's own UAE price library as a stand-in, flagged as such; a composite of the names a research programme happens to cover is an artefact of that coverage, not a market, and it is no longer used as a regressor. The official series (as of 2026-07-24) is now the benchmark, screened for data quality before use, and the regression runs on 253 weekly observations over 4.9 years to 2026-07-17.

The result is beta 1.75, quoted here with its uncertainty because the uncertainty is large: standard error 0.40, R-squared 0.13, a 90% range of 1.09 to 2.40. Two adjustments sit behind it and both matter. First, the regression corrects for thin trading: 84.75% of Modon's shares are held by one entity, so the stock does not move in step with the index within a single week, and an uncorrected regression reads 1.39 — understating the sensitivity by 0.35. Second, the benchmark itself: the official index is materially less volatile than the self-built composite it replaced, and because beta divides the stock's volatility by the market's, a better-diversified benchmark RAISES it. A published long-run adjustment toward the market average reads 1.50, between the two, and is shown as a cross-check rather than adopted. The industry-average route (emerging-market real-estate development, unlevered ~0.45) was tested and rejected as primary: that average is dominated by highly-levered developers unrepresentative of a state platform, and it is kept only as a lower-bound cross-check. This is the largest single mover in the valuation and it moves against the company; section 1.9 sensitises it one standard error at a time rather than around a convention.

Cost of capital	Value	Construction
Risk-free rate, normalised	4.06%	4.48% − 0.42% default spread
Cost of equity	12.56%	rf* + 1.75 × 4.87%
Marginal cost of debt	5.36%	6M EIBOR 3.71% (31-Mar-2026 fixing, dated — the official page refused retrieval twice; ~3bp of rate per 25bp of fixing) + 1.65% margin
after tax	4.53%	× (1 − 15.5%)
Weights	82.9% / 17.1%	market equity / 30-Jun-2026 book debt. Circularity acknowledged: the market's own weights are used while the study argues the equity is mispriced; at the study's own equity value the rate would be ~30bp higher and the DCF ~1% lower
Cost of capital, explicit window	**11.19%**	**weighted**
Cost of capital, terminal	11.92%	weights DERIVED from the model's own FY2030E balance sheet (8.0% debt) — above the explicit rate, as a shrinking debt share demands

Cost-of-debt evidence (loan note, FY2025)	Rate	Maturity
Largest new AED tranche (AED 1,415mn)	6M EIBOR + 0.60%	Jan-2027
AED construction tranches	3M EIBOR + 0.85% to + 2.5%	2028–2030
GBP venue debt (ExCeL, hotels)	SONIA + 0.95% to + 2.05%	2028–2029
USD project tranches	SOFR + margin (to + 4.98%)	2026–2027
Fixed AED tranches	3.32% – 4.36%	2028–2033
Blended marginal rate used	**5.36%**	**above the 4.48% sovereign, as it must be**
Realised effective rate, FY2025	5.9%	interest charge over

		average loan book

Priced stress readings: charging the 17% of revenue earned outside the UAE (the audited geographic split in the revenue note — recognised revenue, not contracted sales) with Egypt's country premium cuts the DCF to AED 2.83; the mid-2026 conflict premium stays retired on the auction evidence, with a +2-point cost-of-equity strip below. Tax at the 15% domestic-minimum floor plus the observed foreign uplift.

1.9 · Sensitivity

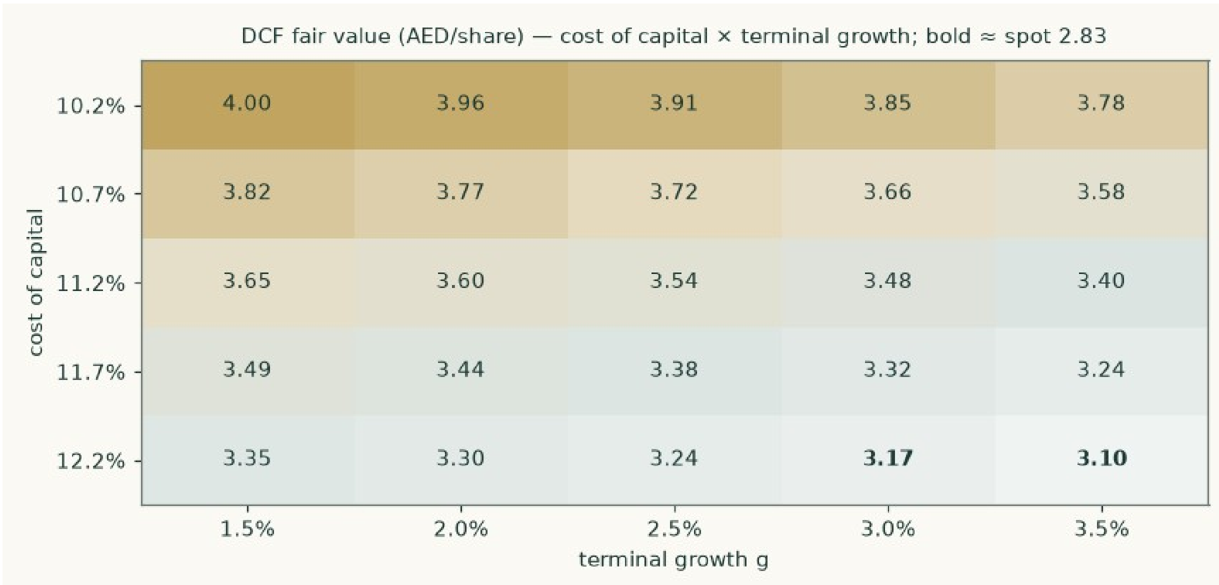

Figure 2 — DCF fair value across cost-of-equity shifts and terminal growth. Rebuilt so the centre cell equals the base case (the first edition's grid used a different terminal convention from its own base — an audit finding). Read the rows left to right: MORE terminal growth now SUBTRACTS value. That is not an error — at revision 3 the terminal cost of capital (11.9%) sits above the terminal return on capital (8.5%), so profit reinvested in the terminal block earns less than it costs, and growing it faster destroys value. At revision 2 the two were within a fifth of a point of each other and the same rows were nearly flat. The gradient inverted because beta rose, not because the business changed.

One-way strip (DCF per share)	−2	−1	base	+1	+2
Beta 0.95 → 2.54 (base 1.75, steps of one standard error)	5.60	4.33	3.54	3.00	2.60
Development margin ±4pts	3.24	3.39	3.54	3.69	3.85
Conversion rate ±6pts	3.20	3.38	3.54	3.68	3.80
New sales 50%→150% of base	2.83	3.19	3.54	3.90	4.26
Working capital ±AED 1bn/yr	3.31	3.42	3.54	3.66	3.78
Receivable days ±60	3.86	3.70	3.54	3.39	3.23
Cost of equity +0 → +2pts (own axis: 0 at base)	3.54	3.38	3.24	3.11	2.98

Each cell is a complete revaluation; scenario driver vectors are published on the Assumptions sheet. Two mechanisms worth naming: a uniform conversion-rate shift raises value (all five years convert more), while pulling conversion forward only in the first period is nearly value-neutral — it drains the backlog that feeds the terminal year; and the receivable-days strip is the priced form of the related-party collection risk.

2 · Technical and price structure

Figure 3 — the last 260 sessions against the 20/50/100/200-day moving averages.

The price closed 2.83 below a falling 20-day (2.88), a falling 50-day (2.95) and a falling 200-day (3.21). Momentum is soft: RSI(14) is ~39 and the daily ATR near 0.05 (~1.8%) points to a normal tape. MACD (12·26·9) is below zero but turning up (−0.04 / −0.04 / +0.00). Over the last year it has ranged 2.76–3.82; the last close sits 26% below that high and 3% above that low. (The MACD histogram is +0.002 — marginally positive; "turning up" rests on that computed sign, shown here at full precision.)

Trading below the whole moving-average stack, under a falling 200-day. A daily close back above 2.88 would clear the nearest resistance and open the 3.57 zone. A close below 2.76 would break the nearest support and open the 2.40 zone.

Nearest levels (computed from swing-point clusters)	AED
Resistance 3	3.57
Resistance 2	3.30
Resistance 1 (nearest)	2.88
Last close (7 Aug 2026)	**2.83**
Support 1 (nearest)	2.76
Support 2	2.70
Support 3	2.40

Levels are recency-weighted swing-point clusters computed from the full price history; the read is computed, not drawn by hand.

3 · Probabilistic price map

Struck from the 7 August 2026 close of AED 2.83 using a volatility model fitted to this market's panel of ADX/DFM names, drift at the short-term dirham rate (no dividend is paid or proposed — a sourced zero), 50,000 paths. Unchanged from the first edition: the price series and anchor did not change.

How much to trust it: tested on 17 non-overlapping three-month windows walked forward over the post-2022 trading regime (earlier windows excluded because the UAE changed its trading week in January 2022 — and, worth stating, part of that history belongs to the smaller predecessor company), the method beat a drift-adjusted random walk by 4.2% on a proper scoring rule, robust across resampling. Coverage runs WIDE: the 80% band contained 94% of outcomes and the 90% band the same 94% — over-coverage, not precision; the bands are, if anything, conservative at this sample size. The forecast percentile of realised prices is statistically indistinguishable from uniform. Calibrated ranges, not promises.

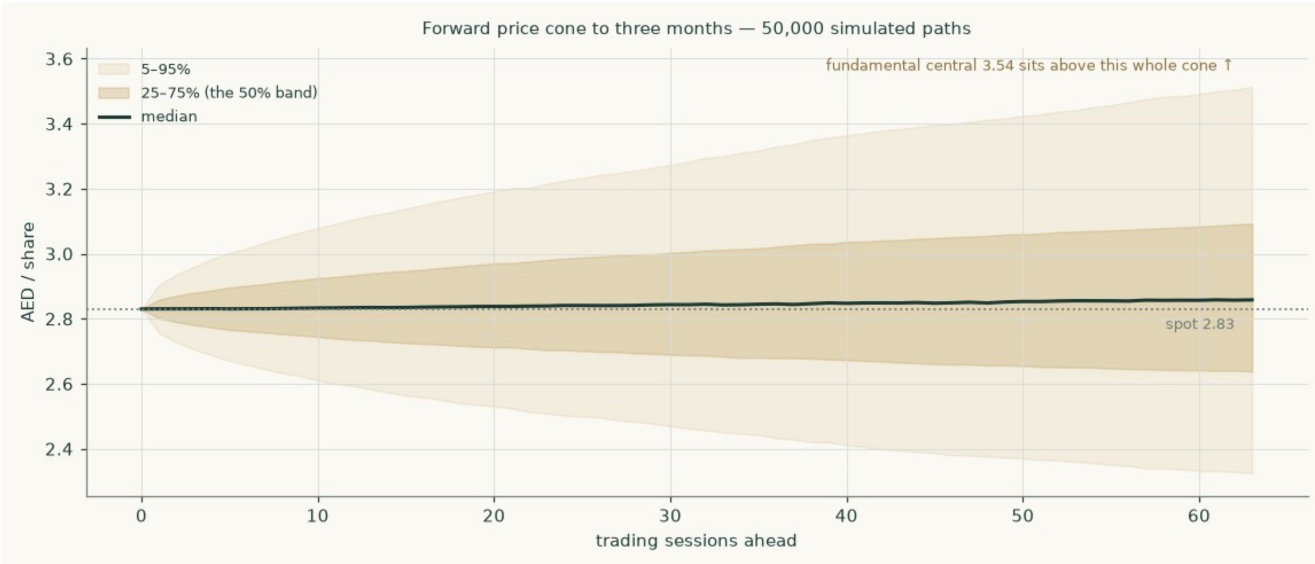

Figure 4 — the three-month cone: median, central 50% band and 5–95% band.

	1 month (to 2026-09-07)	**3 months (to 2026-11-09)**
5th percentile	2.54	2.32
25th percentile	2.72	2.64
Median	2.84	2.86
75th percentile	2.96	3.09
95th percentile	3.17	3.52
P(finish above spot)	52%	53%
P(finish ≥ +10%)	8%	23%
P(finish ≤ −10%)	6%	17%
P(touch +5% at any point)	39%	65%
P(touch −5% at any point)	35%	59%
P(touch +10% at any point)	13%	41%
P(touch −10% at any point)	9%	32%

Calendar-defined windows, settled on the first trading session on or after each date.

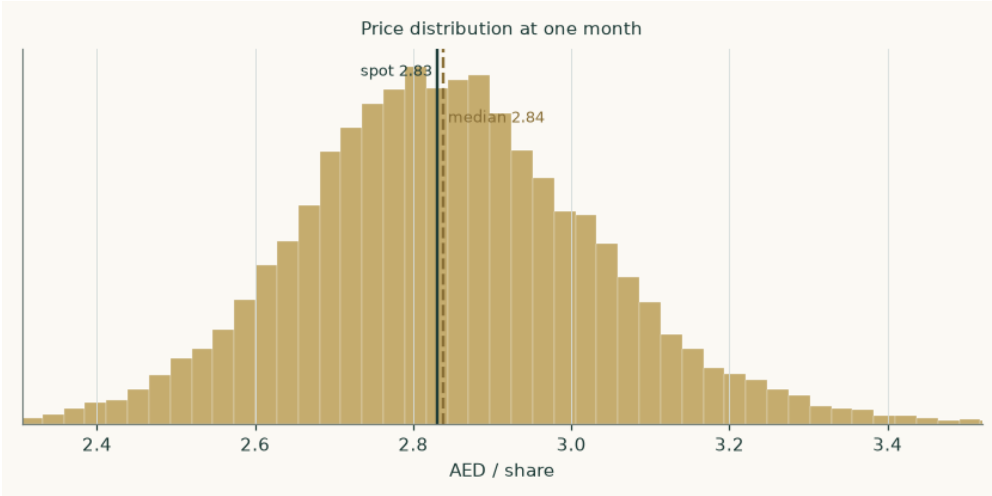

Figure 5 — simulated distribution at one month.

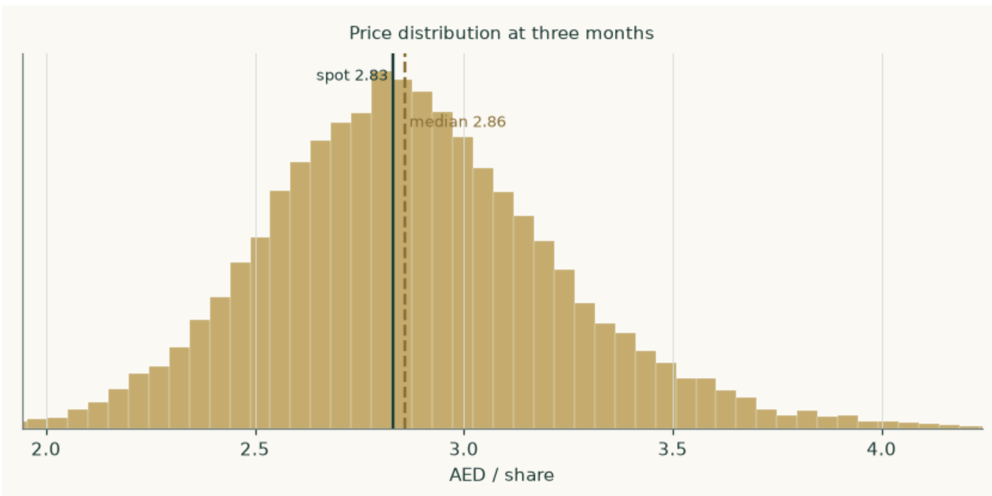

Figure 6 — simulated distribution at three months.

4 · Comparison of the lenses

The gap narrowed but did not close. The cash-flow lenses say AED 2.64–4.13 depending on the sales path; the market lenses say AED 1.46–1.74. Three readings, each priced. First: the market is charging for risk. Making the base cash flows worth AED 2.83 requires a cost of equity of 15.3% — 2.7% above the built-up rate: a hard-currency frontier-credit premium on a AA-sovereign's own developer. Materially less absurd than it sounds, given ~85% state ownership, related-party land sales at 67% gross margins, and a receivable book that consumed AED 5.4bn of cash in six months.

Second: the market is pricing the run-off stress with a further discount — the stress value of AED 2.64 needs a -7% holding-company-style haircut to land on the price. Third: the market lenses anchor on current multiples while the DCF anchors on the contracted backlog — and 68.7% of the DCF's enterprise value is terminal, which is where scepticism belongs; the working-capital honesty of this revision moved cash out of the explicit window and made that share larger, not smaller. The lenses are published side by side rather than reconciled: the cash-flow lens at AED 3.54 is the answer, and the others are shown where they fall rather than averaged into it, so a reader sees the disagreement instead of a number that conceals it.

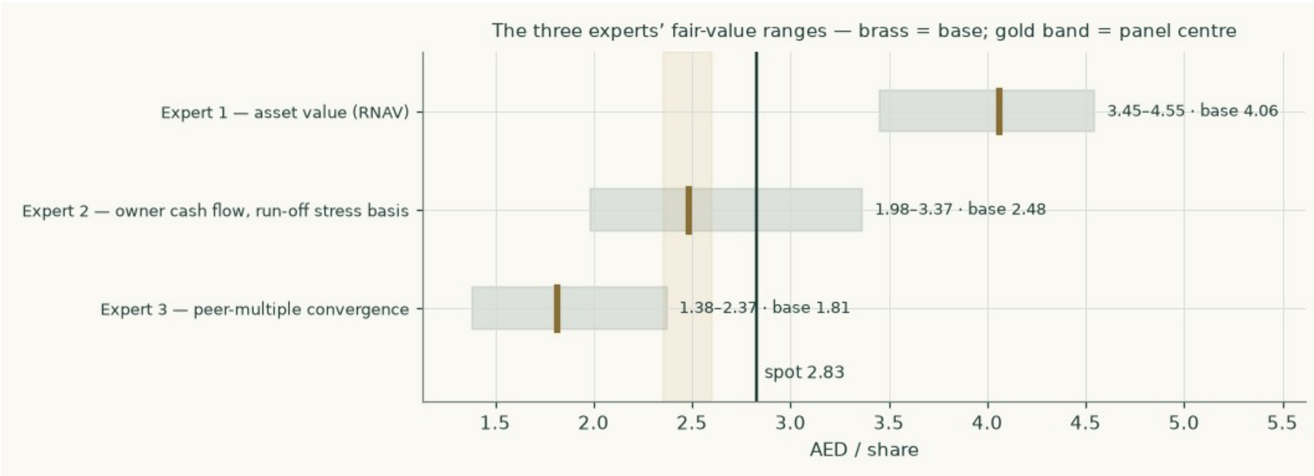

Figure 7 — three expert framings (Appendix C) against the market price.

5 · Catalysts

- **Collections.** FY2026 results (February 2027): whether H2 shows the receivable build-up collecting — the model requires roughly AED 7.5bn of H2 operating cash inflow on the IFRS basis after H1's AED −3.9bn, and says so.
- **Related parties.** Every dirham of the ~AED 10.8bn related-party receivable book (Department of Finance the largest counterparty) collected converts a paper claim into cash — the receivable-days strip in section 1.9 is this risk, priced.
- **Egypt.** Ras El Hekma phase-1 delivery milestones and further precinct launches.
- **Capital returns.** A maiden dividend policy would force the market to price the cash flows as owner earnings; none has been announced.
- **Float.** Any placement widening the ~15% free float changes the relative lens directly.
- **Rates.** The dirham imports US policy: each cut lowers the discount rate and mortgage friction.

6 · Reading the probability zones

The three-month map says: a two-in-three chance the price sits between AED 2.64 and 3.09 on 2026-11-09; 59% odds that AED 2.69 trades at some point (just above the 2.70 support); 65% odds that AED 2.97 trades — just ABOVE the nearest resistance at 2.88, so a touch of it would already be a breakout signal. A reader holding this study's fundamental view should not expect the map to confirm it inside a quarter: the map is calibrated to realised volatility, not to the study's opinion, and a +25% revaluation is a multi-year event, visible first in collections, margins and the dividend decision.

7 · Caveats — what would change our mind

- **Related-party pricing.** More than half of FY2025 land-sale profit came from related-party transactions at a 67% gross margin; arms-length repricing would cut the margin path and every cash-flow lens. Expert 1's land mark-up is set at exactly half that margin for this reason.
- **Collections.** H1-2026 consumed AED 3.9bn of operating cash into receivables. The component build now absorbs cash through FY2028; if receivable days do not fall from 440 as assumed, each 30 days is about AED 0.16 per share (section 1.9).
- **Short clean history.** FY2024 is a perimeter break and FY2023 belongs to a smaller predecessor: exactly two audited years of the modern group exist. Every trend read off this history carries that caveat.

- **Beta.** Beta is the input this valuation is most exposed to. It is now regressed against the exchange's official index and corrected for thin trading, and reads 1.75 — but the 90% range runs 1.09 to 2.40, and across that range the cash-flow lens moves from about AED 2.60 to AED 5.60. A reader who believes the low end believes a materially higher value; the study adopts the measured centre, not the convenient end.
- **Terminal weight.** 68.7% of the DCF's enterprise value is terminal. At the terminal return of 8.5% the block assumes the land bank converts to recognised profit; at FY2025's clean achieved 6.1% the terminal value falls by roughly a sixth and the DCF by about a tenth.
- **Liquidity.** The probability map is fitted to a market panel more liquid than MODON's float; thin trading can gap.

Appendix A · Financial statements

A.1 · Income statement — audited years, H1-2026 actual, forecast

AED mn	FY2023*	FY2024**	FY2025	H1-26A	H2-26E	FY27E	FY28E	FY29E	FY30E
Revenue	994	6,511	13,829	9,188	11,046	26,019	32,007	34,928	36,189
Gross profit	600	2,317	5,025	3,201	4,165	9,619	11,784	12,807	13,143
EBITDA (house basis)	673	9,795	4,896	—	3,481	7,734	9,361	10,149	10,462
Depreciation & amortisation	28	265	610	—	341	709	736	765	794
EBIT	646	9,530	4,285	—	3,140	7,026	8,625	9,384	9,668
Net finance result	9	-157	-127	—	-69	-91	-1	189	469
Associates & joint ventures	-1	115	264	—	95	210	227	245	264
Profit before tax	653	9,488	4,421	2,601	3,166	7,144	8,851	9,818	10,401
Income tax	-80	-99	-495	-401	-491	-1,107	-1,372	-1,522	-1,612

Attributable to owners	461	9,423	4,020	2,163	2,622	5,916	7,329	8,130	8,613

** Q Holding perimeter. ** Includes the AED 9,192mn bargain gain (ex-gain profit AED 197mn); the FY2024 EBITDA of 9,795 shown here is dominated by it — house basis, labelled, dual-framed. "Profit before tax" includes small discontinued items, as presented. FY2026E full year = H1 actual + the H2-26E stub.*

A.2 · Balance sheet

AED mn	FY2024	FY2025	30-Jun-26A	H2-26E	FY27E	FY28E	FY29E	FY30E
Receivables incl. related-party	12,844	16,635	22,156	24,392	30,653	35,953	37,320	36,684
Inventories + development WIP	32,048	33,409	34,087	34,435	35,239	34,923	33,972	32,687
Payables incl. advances + related-party	18,030	23,102	22,289	23,935	27,881	31,346	32,075	32,263
Net working capital	26,862	26,943	33,954	34,892	38,010	39,530	39,217	37,108
Cash and bank balances	7,010	12,642	12,303	14,345	16,462	20,581	27,210	36,089
Debt incl. related-party loan	5,364	6,789	9,542	10,300	10,500	9,700	8,800	7,900
Net debt (− = net cash)	**-1,646**	**-5,853**	**-2,762**	**-4,045**	**-5,962**	**-10,881**	**-18,410**	**-28,189**
Equity attributable to owners	49,676	53,903	56,397	59,019	64,935	72,264	80,394	89,007

Forecast columns roll only the lines the model drives; asset lines it does not forecast are left to the workbook. FY2023 (Q Holding perimeter) appears in A.1; its balance sheet is in the workbook.

A.3 · Cash-flow markers

AED mn	FY2024 A	FY2025 A	H1-26A	H2-26E	FY27E	FY28E	FY29E	FY30E
IFRS operating cash flow (audited/reviewed)	3,231	3,860	-3,921	—	—	—	—	—
Model construct: NOPAT + D&A − ΔWC (a DIFFERENT measure — pre-interest, model tax)	—	—	—	2,057	3,527	6,505	9,008	11,073
Capital expenditure	1,247	1,261	312	700	1,500	1,550	1,600	1,650
Free cash flow to firm	—	—	—	1,357	2,027	4,955	7,408	9,423

The two operating rows are different measures and are no longer presented as one series (an audit finding). The model's FY2026 implies roughly AED 5,978mn of H2 operating inflow on the IFRS basis after H1's outflow — stated in section 5 as the thing to watch.

Appendix B · Peers, risks and research register

B.1 · Peer set

Company	Market	FY2025 revenue	FY2025 attributable NP	Trailing P/E (attr.)	Backlog (own disclosure, dated)
Aldar Properties	ADX	33,800	7,548	8.10x	71,700 (FY25 dev.)
Emaar Properties	DFM	49,600	17,599	5.78x	155,000 (FY25 group)
Emaar Development	DFM	27,490	11,316	4.73x	125,200 (FY25)
Modon Holding	**ADX**	**13,829**	**4,020**	**11.51x**	**65,400 (30-Jun-26 group)**

AED mn; one attributable basis; every backlog labelled with its object and date. Peer figures from the peers' own audited filings and releases; prices 7-Aug-2026.

B.2 · Risk register

Risk	Where it bites	How it is priced here
Related-party sales concentration and pricing	development margin, receivables	margin glide; Expert 2 haircut; margin and receivable-day strips
Receivable collection timing	working capital	component build absorbs through FY2028; ±60-day strip
Abu Dhabi residential cycle turns	new sales, pricing	run-off stress priced in full (section 1.7)
Egypt macro and FX on Ras El Hekma	international leg	Egypt-premium stress: AED 2.83 per share
Rates higher for longer	discount rate, demand	+2pt cost-of-equity strip
Free float and index exclusion	the multiple, not the cash	60% weight on market lenses IS the discount; no second haircut
Execution at masterplan scale	capex, delivery cadence	conversion strip; the terminal return held below the model's own path

B.3 · Research register

Area	What was established	Source	Date
Global	AED is hard-pegged to the USD; CBUAE Base Rate 3.65%, held since 17-Jun-2026, tracks the Fed. The July-2026 AED sovereign auction printed just 4bp over comparable US Treasuries	CBUAE Base Rate (house monetary-policy calendar); UAE MoF/CBUAE July-2026 T-Bond auction (WAM)	2026-07-30

Global	UAE tender price inflation ~3.3% in 2025, forecast ~2.7-4.5% for 2026 (Turner & Townsend UAEMI 2025), with a post-conflict hawkish tail (one QS house sees 6-9%) as fuel/freight/insurance feed through; materials ~60% of baseline cost	Turner & Townsend UAE Market Intelligence 2025; MEED/Currie & Brown 2026 forecasts	2026-07-01
Global	Cross-border capital is the marginal buyer of Abu Dhabi residential: foreign buyers drove 62% of the y/y growth in residential sales value in 2025, and Modon booked AED 6.6bn of international sales (Egypt+Spain+JV) across 2,115 units in 2025	ADREC Abu Dhabi Real Estate Market Report 2025; Modon Annual Report 2025	2026-01-31
Global	Negative search — nothing found (UAE sanctions exposure real estate; Modon supply chain disruption; construction materials import restrictions UAE 2026)	negative search	2026-08-09
Country	UAE rated Aa2 (Damodaran Jan-2026: adjusted default spread 0.42%, CRP 0.64%, total ERP 4.87%); AED T-Bond maturing Jan-2031 auctioned at 4.48% YTM in July-2026; EIBOR 3M 3.66% / 6M 3.71% (31-Mar-2026); AED peg unquestioned	Damodaran ctryprem (Jan-2026); UAE MoF July-2026 auction via WAM; CBUAE EIBOR fixings	2026-07-30
Country	UAE corporate tax 9% from 2023; Domestic Minimum Top-up Tax (15%) effective 2025 for large groups — Modon's FY2025 charge includes AED 350.4mn of DMTT, and its disclosed effective-rate range is 9%-23.5% across jurisdictions	Income tax note 11, audited FY2025 consolidated financial statements	2026-02-18
Country	Abu Dhabi government consolidation: on 30-Oct-2025 IHC and ADQ sold their entire stakes to L'imad Holding Company PJSC, wholly owned by the Abu Dhabi Government — Modon is now a majority government-owned entity under IAS 24, embedded in the emirate's development agenda	Note 1 / note 30, audited FY2025 consolidated financial statements	2026-02-18
Country	Negative search — nothing found (FTSE ADX General Index daily history: stooq (^adx), Yahoo FADGI.FGI / FADX15.FGI (1 point only), investing.com SSR table (~1 month) and api.investing.com (403), TradingEconomics chart API (proxy 502), WSJ/MarketWatch michelangelo (unknown instrument), apigateway.adx.ae + www.adx.ae (Cloudflare challenge))	negative search	2026-08-09
Industry	Abu Dhabi 2025: AED 142bn total real-estate transactions (+44% y/y) on 42,814 deals (+52%); residential sales AED 76bn (+67%); off-plan 71% of residential transactions; 56 new projects launched	ADREC (Abu Dhabi Real Estate Centre) 2025 market report	2026-01-31
Industry	Residential price momentum is buyer-led and cash-led: 87% of residential sales value registered as cash in 2025, with foreign buyers driving 62% of growth; Modon's blended realised price was AED 7.02mn/unit in Abu Dhabi (29.8bn/4,243 units) vs AED 3.12mn/unit internationally (6.6bn/2,115 units)	ADREC 2025 report; Modon Annual Report 2025 sales disclosures	2026-01-31
Industry	Abu Dhabi development remains a near-duopoly of Aldar and Modon at masterplan scale, with Bloom Holding, Reportage and Q Properties-era mid-tier players below; Dubai majors (Emaar, Emaar Development) compete for the same international buyer but not on Abu Dhabi land	ADREC 2025 report; company disclosures	2026-01-31
Industry	Negative search — nothing found (modular construction disruption UAE developer margins; proptech substitution of exhibition venues (virtual events share post-2024))	negative search	2026-08-09
Industry	Aldar FY2025: revenue AED 33.8bn (+47%), net profit 8.8bn (+36%), EBITDA 11.2bn, group sales 40.6bn, backlog AED 66.5bn Aldar-led (167bn incl. government projects). Emaar FY2025: property sales 80.4bn (+16%), revenue 49.6bn (+40%), backlog 155bn. Emaar Development: UAE sales 71.1bn, backlog 134.3bn	Aldar Q4-FY25 earnings release (aldar.com); Emaar FY2025 press release (emaar.com)	2026-02-09
Company	Masterplan pipeline: Hudayriyat Island >50mn sqm gross land, 40,000 planned units; Ras El Hekma (Egypt) 170.8mn sqm with Modon lead developer on the 56mn sqm phase 1, 500,000+ planned units, first precinct (Wadi Yemm) launched at AED 5.8bn across 2,109 units; La Zagaleta (Spain) land sales continuing	Modon Annual Report 2025 (masterplan disclosures)	2026-03-31
Company	H1-2026 reviewed interims: revenue AED 9,188mn (+40% y/y), gross profit 3,201mn, PBT 2,601mn, profit 2,202mn; development backlog converting on schedule; loans and borrowings 8,542mn (+66% since Dec-2025) as construction accelerates	Interim condensed consolidated financial statements, 30-Jun-2026 (reviewed)	2026-08-07
Company	FY2025 results release: revenue backlog AED 46.0bn (93% development sales), adjusted EBITDA 4.9bn (35.2% margin), net cash 1.8bn on the company's own definition (available cash incl. qualifying escrow, less total debt incl. the related-party loan); real-estate sales 36.3bn across 6,358 units; hospitality 7,137 keys at 71% occupancy; AIM occupancy 97%; 896 events, 6.3mn visitors	Modon FY2025 results announcement, modon.com media centre, 18-Feb-2026	2026-02-18

Company	FY2024 is a perimeter break: the Modon Properties/ADNEC combination entered via share issues of AED 27.4bn and a bargain-purchase gain of AED 9,192mn; FY2024 reported profit 9,389mn falls to ~0.2bn excluding the one-off (company's own framing). FY2023 and earlier are the Q Holding perimeter	Note 4 business combinations, audited FY2025/FY2024 statements; FY2025 results release	2026-02-18
Company	Named transaction: on 30-Oct-2025 IHC and ADQ disposed of their entire shareholding to L'imad Holding Company PJSC (wholly owned by the Abu Dhabi Government); the FY2025 results release states an 84.75% L'imad stake	Note 1, audited FY2025 consolidated financial statements; FY2025 results release	2026-02-18
Company	No dividend paid to owners in FY2024 or FY2025 (statements of changes in equity show only an AED 243mn NCI dividend in 2025) and none proposed with FY2025 results; no buyback; Group CFO signature changed between the FY2025 filing (Bill O'Regan) and the H1-2026 interim (Matt Matharu)	Audited FY2025 statements; H1-2026 interim; FY2025 results release	2026-08-07
Company	Four audited fiscal years assembled from the company's own filings: FY2025 (Modon, audited, signed 18-Feb-2026), FY2024 (comparatives in the FY2025 filing + the scanned FY2024 original), FY2023 and FY2022 (Q Holding filings). H1-2026 reviewed interim on top. All retrieved directly from modon.com/investor-relations	Audited consolidated financial statements FY2022-FY2025; H1-2026 interim	2026-02-18
Company	FY2023 audited consolidated financial statements (Q Holding PSC perimeter): revenue AED 994mn, profit 574mn, total assets 21.3bn	Audited FY2023 consolidated financial statements (Q Holding PSC)	2024-02-15
Company	FY2022 audited figures via the FY2023 filing's comparative column: revenue AED 720mn, profit 823mn, total assets 19.5bn	Audited FY2023 consolidated financial statements, FY2022 comparatives	2024-02-15
Company	H1-2026 results release (29-Jul-2026): revenue backlog AED 65.4bn (doubling y/y, +42% vs FY2025), 95% development; H1 real-estate sales AED 26bn incl. 23bn Abu Dhabi (Hudayriyat Golf Estates AED 13bn within days); net debt AED 912mn on the company definition with AED 8.6bn unrestricted cash; adjusted EBITDA AED 3.0bn (32.6%); hospitality 3,613 keys across 16 owned/operated/JV hotels. (added at revision 2 after external audit)	Modon H1-2026 results announcement, modon.com media centre, 29-Jul-2026	2026-07-29
Industry	Own-stock weekly regression against the PUBLISHED INDEX OF THE EXCHANGE the stock is listed on (FTSE ADX General, raw_indices/AE/FADGI.csv, as of 24-Jul-2026), produced by the house regression module and accepted by the beta-provenance gate. Beta 1.746 on 253 weekly observations over 4.9 years (SE 0.397, R2 0.128, 90% range 1.09-2.40, usability gate PASS), Dimson thin-trading corrected - warranted by a float with 84.75% in a single holder, and worth +0.351 of beta against the uncorrected 1.394 on the same weeks. Long-run-adjusted (Blume) cross-check 1.497. SUPERSEDES two earlier regressors: the revision-2 equal-weight composite of the house UAE library (1.03) and an intermediate study-local naive regression on the official series (1.278). A composite of the names this programme happens to cover is a coverage artefact, not a market. Damodaran EM industry route stays rejected as primary (RE Development unlevered 0.45 dominated by highly-levered Chinese developers, D/E 1.97); retained as a lower-bound cross-check	Official FTSE ADX General daily history (raw_indices/AE/FADGI.csv); house beta regression module; Damodaran betaemerg.xls (07-Jan-2026)	2026-08-10

Every claim the model rests on, with source and date. The companion bibliography carries the full input-by-input register — now including the corrections adopted from the external audits, each marked.

Appendix C · Three experts, worked in full

Three framings, each taken to a number by a different method, with stated blind spots and falsifiers. Labelled Expert 1, 2 and 3. Expert 2 builds on the study's own run-off scenario — a derived framing with an independent overlay, labelled as such, not a third independent view.

C.1 · Expert 1 — the asset value (revalued net assets)

Worldview: a developer is a warehouse of land bought below market. Works when the land is carried far below realisable value; fails when the buyer of first resort is a related party whose price is the appraisal.

Line	AED mn

Attributable equity, 30 Jun 2026 (reviewed)	56,397
Land bank at cost (land plots within inventories, FY2025 note)	26,611
Mark-up: 33.7% — EXACTLY half the realised 67.4% related-party land-sale margin (the first edition said "half" but applied 35%; aligned)	8,968
Work-in-progress mark-up: 15% on AED 6,488mn	973
Revalued net asset value	**66,338**
Per share (16,347mn shares)	4.06
Range: appraisal haircut 15% to premium 12%	3.45–4.55

Named sensitivity: each 10 points of land mark-up is AED 0.16 per share. Falsifier: two consecutive halves of arms-length land sales clearing below 20% gross margin collapses the mark-up toward zero and this value toward book (AED 3.45).

C.2 · Expert 2 — owner cash flow on the run-off stress (derived framing)

Worldview: value only the cash an owner could take out if no new story arrives; treat affiliate receivables as impaired until collected. Works at cycle tops; structurally blind to compounding growth.

Line	Value
Run-off stress DCF (the study's own scenario)	AED 2.64/sh
Related-party receivable book, 30 Jun 2026	AED 10,756mn
Haircut: 25% for timing and collection	− AED 0.16/sh
Expert 2 value	**AED 2.48/sh**
Range: deeper haircut, to the base DCF less 5%	1.98–3.37

Named sensitivity: each 10 points of haircut is AED 0.07 per share. Falsifier: the Department-of-Finance receivable collecting on schedule through FY2026 removes the haircut and moves this expert to AED 2.64.

C.3 · Expert 3 — the market pricer

Worldview: the peer multiple is the verdict of everyone else's money. Works when the peer set is deep; prices inflections only after the fact.

Line	Value
FY2026E attributable profit (H1 actual + H2 model)	AED 4,785mn
Multiple: 6.2x — the arithmetic MEAN of the rebuilt attributable peer set (4.73/5.78/8.10; the first edition claimed "centre" but used 6.5x)	
Implied equity value	AED 29,668mn
Per share	**AED 1.81**
Range: trough 4.73x to leader 8.10x	1.38–2.37

Named sensitivity: each turn of P/E is AED 0.29 per share. Falsifier: a dividend policy plus a float above 25% would justify migrating toward the cash-flow lenses.

C.4 · Cross-examination

- Expert 1 to Expert 2: your haircut double-counts — the run-off already starves the related-party channel. Expert 2 concedes in part: the haircut stays on the stock of receivables, not the flow. Sustained in part.

- Expert 2 to Expert 1: your mark-up is circular — the margin you halve was set by related-party sales. Expert 1 concedes the circularity; the falsifier (arms-length clearing prices within two reporting periods) is the test. Acknowledged.
- Expert 3 to both: the shares trade at 11.5x attributable earnings against a leader at 8.1x — the market has voted. Experts 1 and 2 reject the inference: a 15% float is not a verdict but the absence of one. Rejected, reason stated.

C.5 · Three in one room

One sentence each. Expert 1: "the land covers the price at AED 4.06." Expert 2: "paid to wait even in run-off — AED 2.48 — if the affiliates pay their bills." Expert 3: "until the float and dividend exist it is worth the peer mean: AED 1.81." Median AED 2.48 — between the study's market lenses and its cash-flow lenses, which is where the disagreement lives.

C.6 · Divergence table

Assumption	Expert 1	Expert 2	Expert 3	Gap it drives
Land bank worth above cost	+34%	0%	ignored	AED 0.55/sh
Related-party receivables	face value	−25%	face value	AED 0.16/sh
Sales path	irrelevant (assets)	run-off stress	FY2026E only	AED 0.90/sh between base and stress
Multiple regime	n/a	n/a	6.2x peer mean	AED 0.38/sh vs the study's 7.5x

About this study

Revision 2, produced the same day as the first edition after external audits of that edition. Every number in the study, the Excel model and the bibliography comes from one computed model; the delivered workbook is verified cell by cell against it — 617 formula cells reproduce the model exactly, zero unresolvable, zero unchecked — and a driver test on the delivered file confirms 25 drivers reprice the workbook in the asserted direction with no dead inputs (the published scenario-vector rows are display inputs for the pasted engine re-runs and are inert by design, stated on the sheet). The historical record is built exclusively from the company's own audited statements, reviewed interims and results announcements; where a figure is both disclosed and derivable, the disclosed figure is carried. The audits' accepted findings and this study's own re-audit findings are implemented and marked where they appear; their rejected findings are answered with receipts in the build record.

Disclosure

Educational analysis. Not investment advice, not a recommendation, not an offer. No rating is expressed. The central is one lens — the cash-flow model — and not an average of several; it is a model output rather than a price target, it is published inside a stated range of that same model's own paths, and the other lenses are shown beside it wherever it appears. The authors hold no position in MODON. Data as of 9 August 2026; prices as of the 7 August 2026 close.
