Testahil — Emirates Central Cooling Systems Corporation PJSC (DFM: EM

Companion model · Independent Valuation Study · Educational analysis · Not investment advice

What this workbook is. A transparent companion to the Empower valuation study. Every blue cell is an input; every black cell is a formula; green cells link across sheets.

IT IS FORMULA-DRIVEN. Every figure that can be derived arithmetically from a driver is a live formula, so you can change a blue cell on Assumptions and watch the model reprice: the cost of capital is built from the risk-free rate, beta and the premium rather than pasted; the revenue engine multiplies per-refrigeration-ton rates by the connected-capacity path; and the income statement, balance sheet, cash flow, ratios and all four lenses chain off the same cells.

EXACTLY THREE THINGS ARE PASTED VALUES, and it is worth knowing which:

1. AUDITED AND DISCLOSED HISTORY — the FY2023-25 statement lines, the 30-Jun-2026 reviewed bal sheet, disclosed connected capacity, and the consumption revenue disclosed in the auditor's key-audit-matter section. Where a line is both disclosed and derivable, the workbook carries the DISCLOSED figure: the primary record is not a calculation.
2. THE UNIT BUILD'S BASE ANCHORS — the per-RT revenue rates, the electricity-and-water pass-throu ratio, the cash cost bases, the depreciation rate, capex per added RT and the working-capital ratio. Each anchor is pasted once on the Assumptions sheet with its source, and everything downstream of it is a formula.
3. WHOLE-MODEL RE-RUN GRIDS — the probabilistic price map, the discount-rate x growth grid, the consumption-recovery grid, the consumption-persists framing and the bear/bull cases. Each such cell is a complete revaluation of the entire model, so it cannot be a single formula. THESE GRIDS DO NOT REDRAW WHEN A DRIVER IS CHANGED — the live one-way row on the Sensitivity sheet doe

How revenue is built. Not as one growth rate. Consumption revenue is a per-RT rate times average connected refrigeration tons, with the FY2026 warm-winter shock and its recovery as explicit, separate drivers; capacity and connection revenue is its own per-RT rate on the same capacity path; pipes are carried flat. Costs escalate each on their own driver: DEWA electricity and water follows the consumption leg, wage-class lines follow the wage escalator, the concession interest amortises.

The two contested judgements are shown BOTH WAYS, never averaged: the 9% corporate-tax and 15% top-up-tax framings run as parallel columns through the cost of capital, the DCF and the bridge; and the consumption-recovers and consumption-persists cases are both on the Fundamental Valuation sheet.

What it is not. Not investment advice, a recommendation, or a price target. Values are model outputs shown as ranges. The probabilistic price map is dispersion, not a forecast of value.

Sourcing. FY2023, FY2024 and FY2025 statement lines come from the company's own audited consolidate financial statements; the 30-Jun-2026 position from the reviewed interim statements; capacity and guidance from the company's H1-2026 earnings materials. Every input on the Assumptions sheet carries its source and date in column H.

Currency. AED million unless stated. Spot AED 1.50 (07-Aug-2026 close). Sheets: READ FIRST · Summary · Fundamental Valuation · Assumptions · SOTP Bridge · Segments · Relative & Normalized · DC

source and date). Empower trades at a discount to Tabreed on EV/

Caution

roughly 4.6x net debt / EBITDA against Empower's 1.8x, and a concession mix that skews the EV multiple

a vertically-integrated generation and distribution utility, not a district-cooling comparable

tariff regimes and concession structures differ materially by emirate and state

/EBITDA with less than half the leverage; the model's relative lens applies the peer multiple to Empower r's own forecast EBITDA rather than endorsing either price.
