Fertiglobe plc (ADX: FERTIGLB) — Sources and Documentation

Companion document to the valuation study dated 9 August 2026. It records where every number in that study came from.

What this document is. The complete source record behind the valuation study. It lists every input the model uses, together with its value, the date the value belongs to, the document it was taken from and how it was constructed — so that a reader can retrace any figure in the study back to where it came from, and disagree with it on the evidence rather than on trust.

What it is not. It is not a summary of the study and it carries no conclusions. Where a figure was derived rather than disclosed, the derivation is stated in the source column. Where something was looked for and not found, it appears at the end under what could not be sourced, rather than being quietly filled in.

The four layers of research

Every input belongs to one of four layers of research — global, country, industry and company — and the company layer is shown split between the filed financial statements and the investor communications, because the two channels carry different kinds of fact and a reader is entitled to see how much of the analysis rests on each. A fifth heading, market, covers the traded price of the share itself.

Layer	What it covers
Global	Worldwide interest rates, energy and commodity prices, and the trade and shipping conditions that frame every producer in the sector
Country	Sovereign data for each country the company operates in — credit rating, default spread, equity risk premium, corporate tax regime — and the dirham peg
Industry	Nitrogen fertiliser supply and demand, published benchmark prices by product and region, import tariffs, and the listed competitive set
Company — filed financial statements	The company's own audited annual and reviewed interim financial statements, and the notes to them. Every historical income statement, balance sheet and cash flow figure in the study comes from this layer and from nowhere else
Company — investor communications	Management discussion and analysis reports, investor presentations and the results-call transcript. These carry the sales volumes, installed capacity, utilisation, benchmark price tables and the delivered gas price — none of which appears anywhere in a financial statement
Market	The share's own traded price history on the Abu Dhabi Securities Exchange, and the local price library it was regressed against

Primary documents relied upon

Every company document read for this study. All were obtained from the company's own investor relations pages, which responded normally on 9 August 2026: the investor relations landing page and the full results and reports archive were both reachable, and the four audited annual filings were downloaded and read in full at the addresses below (86, 80, 75 and 74 pages respectively). No company figure in this study comes from anywhere other than these documents.

What was taken from each

Document	What the study takes from it
Consolidated Financial Statements 2025	Signed by PricewaterhouseCoopers on 4 March 2026. The whole FY2025 income statement, balance sheet and cash flow, with the FY2024 comparative column; the two-segment revenue and adjusted earnings note; expenses by nature; the income taxes note including the statutory rate range; loans and borrowings tranche by tranche with each margin over the reference rate; the accrued gas liability; geographical non-current assets by country; the shareholding note; and the borrowing-cost capitalisation rate that the study examines and does not use
Consolidated Financial Statements 2024	The FY2024 comparative figures and segment split, and the Key Audit Matter on the accrual for increased gas cost at the Algerian plant — the disclosure that first establishes the size and the unsettled status of that liability
Consolidated Financial Statements 2023	The FY2023 year and, through its own comparative column, the FY2022 cycle peak: revenue, cost of sales, tax charge, tax paid and profit before tax, all four of which feed the four-year aggregate tax measures
Consolidated Financial Statements 2022	The fourth complete audited year, confirming the FY2022 peak figures carried as comparatives and completing the four-year run used for the tax work
Interim Financial Statements, three months ended 31 Mar 2026	The accrued gas liability at the first-quarter date, which shows the balance still building quarter by quarter rather than having settled
Interim Financial Statements, six months ended 30 Jun 2026	The reported first half of the study year in full — revenue, cost of sales, operating profit, profit attributable to owners, the balance sheet, gross debt, cash and net debt. Half of 2026 is fact and is carried as fact rather than modelled
Q4 2025 Results Report	Sales volumes by product for 2024 and 2025, own-produced and third-party; maintenance capital expenditure; and the benchmark price table for urea, ammonia and European gas
Q2 2026 Results Report	First-half 2026 sales volumes by product, segment revenue and earnings, capital expenditure, urea utilisation, the first-half benchmark price table, the mid-July urea price, and the European tariff schedule on Russian and Belarusian product

Document	What the study takes from it
Q2 2026 Results Presentation	Installed capacity by product, and the company's own compilation of global urea demand growth against capacity additions to 2030
Q2 2026 Results Call	The chief executive's statement that gas pricing in Egypt and Algeria is product-linked, and the delivered gas price for the second quarter of 2026 both excluding and including the Algerian profit-share

Primary sources outside the company

Source	Publisher	Date read	What was taken from it
Country default spreads and risk premiums (ctryprem)	A. Damodaran, NYU Stern	9 Aug 2026	The credit rating, adjusted default spread, sovereign credit-default-swap spread, country risk premium and equity risk premium for Abu Dhabi, Egypt and Algeria, each read from that country's own row on both a rating and a swap basis, plus the corporate tax rate for each. Address: https://pages.stern.nyu.edu/~adamodar/New_Home_Page/datafile/ctryprem.html
Series DGS10 — 10-year Treasury constant maturity	Federal Reserve Bank of St Louis	6 Aug 2026	The dollar risk-free base. Address: https://fred.stlouisfed.org/series/DGS10
Secured Overnight Financing Rate	Federal Reserve Bank of New York	6 Aug 2026	The floating reference rate the company's own dollar facilities are priced over
Dirham peg to the US dollar	Central Bank of the UAE	7 Aug 2026	The fixed rate of 3.6725 dirhams to the dollar, held since 1997, used to translate the dollar valuation into the listing currency
Daily price history for FERTIGLB on the Abu Dhabi Securities Exchange	Study price history	to 7 Aug 2026	The anchor price, the volatility estimate, the moving-average structure and the weekly returns used in the beta regression
Daily price history for the covered UAE equity library	Study price history	to 7 Aug 2026	The published FTSE ADX General index, the regressor for an ADX-listed share

Every input the model uses

The complete list, grouped by research layer. Each row gives the value as the model holds it, the date the value belongs to, and the document it came from together with how it was constructed where it was not simply read off a page. Financial-statement lines are in millions of US dollars, the currency the company reports in; volumes are in thousands of tonnes; prices are per tonne or per million British thermal units; rates and shares are shown as percentages. Nothing in the study is computed from a figure that does not appear here.

Market — 2 inputs

Input	Value	Date	Source and construction
spot aed	AED 2.54	2026-08-07	ADX closing price, FERTIGLB, from the study price history
beta	0.931	2026-08-07	Own-stock weekly regression against the FTSE ADX General index (published, as of 2026-07-24), 4.68 years, n=242, R-squared 0.100, standard error 0.283

The judgements, and what would overturn each

These are the places where the analyst chose rather than observed. They are collected here so that a reader can find every one of them without reading the whole study, and each carries the evidence that would overturn it — stated in advance, in observable terms.

Judgement	What was chosen	Why	What would overturn it
Gas cost moves with the product price, at about 0.48 of every dollar	Cash cost per tonne is modelled as $43 plus 0.481 times the realised price per tonne, fitted across the three disclosed periods (fit quality 0.960). It replaces an inflation-escalated cost stack entirely	The chief executive stated on the results call of 6 August 2026 that gas pricing in Egypt and Algeria is product-linked. The relationship is measured from disclosed segment revenue and earnings rather than assumed, and it survives removing the Algerian gas catch-up charge (slope 0.489 without it), so it is not an artefact of that one item. It is corroborated physically: the fitted cost step implies about $4.74 per MMBtu of extra gas cost against the $6 per MMBtu the company disclosed for the second quarter of 2026	Two consecutive periods in which cost per tonne fails to follow realised price at anything close to this slope — most plainly, a fall in product prices that is not followed by a fall in cost per tonne. A published Algerian or Egyptian gas formula showing a fixed price would overturn it outright
The product price path — carried BOTH ways, never averaged into one number	Framing A reverts urea to $440 per tonne by 2028 and holds there; framing B holds it near $550. Both are run all the way to a value: AED 1.81 under A and AED 2.68 under B. Both appear in the summary, the body, the workbook and an expert's range	This is the single most consequential contested judgement in the study, and averaging the two would hide it. Framing A treats the 2026 spike as a war premium on top of a marginal-cost anchor set by European gas; framing B rests on the company's own sourced supply and demand balance — demand growth outside China of about 11.4 million tonnes to 2030 against about 9.1 million tonnes of additions — and the rising European tariff wall on Russian and Belarusian product	Framing A is overturned by two or more quarters of urea holding above $520 per tonne with the Strait of Hormuz open and freight normalised. Framing B is overturned by Chinese export quotas returning at scale, or by any of the announced projects that have not reached a final investment decision doing so

Judgement	What was chosen	Why	What would overturn it
The forecast tax rate is the average of three sourced estimates	13.1% — the mean of the four-year aggregate reported effective rate (10.4%), the four-year aggregate cash rate (15.7%) and a jurisdiction-weighted statutory build (13.4%)	No single reported year is usable. The group's own statutory rate ranges from zero to 25% because certain entities hold qualified free-zone status, and the reported effective rate of 4% in 2025 and 7% in 2024 was flattered by items that do not recur. Taking the average of three independently constructed measures is the honest answer to a rate that is genuinely uncertain	A completed review of free-zone qualification, or the loss of it at a material entity. The study sensitises the rate from 8% to 20%, and the value moves by roughly a tenth across that span
Beta of 0.931 from the share's own history, despite a weak fit	0.931, from 242 weekly observations over 4.7 years against the published FTSE ADX General index — the index of the exchange the share is listed on. It is used as measured, not adjusted toward one	The regression explains only 10.0% of the variance and the standard error is 0.283, so the 90% interval runs from 0.47 to 1.40 — a genuinely weak fit, which is what a 12.6% free float on a commodity producer should produce. The share tracks nitrogen prices, not the local index. The study says so plainly rather than borrowing a foreign peer beta that would look firmer than the evidence is	A materially higher free float, or a longer history, that lifts the explanatory power. The whole 90% interval is priced in the sensitivity table: at 1.40 the value falls by roughly a fifth. A reader who prefers the adjusted-toward-one convention would use 0.954, which is shown
The terminal return on capital is triangulated, not carried from the last forecast year	13.5% — the mean of the final-year book return (22.2%), the return on replacement cost (6.8%) and a long-run sector return for merchant nitrogen producers (11.5%). It is published as a diagnostic and does not enter the terminal: that value is built from the capital the plants need to be kept whole, US$394.5m a year on the asset life the accounts themselves disclose, so no assumed return sets the charge	Book invested capital is depreciated historical cost, so a book return above a fifth overstates what the next tonne of capacity actually earns; replacement cost understates it, because the existing plants carry a gas position a new entrant cannot buy. Neither is right on its own	A greenfield nitrogen project reaching a final investment decision at a disclosed capital cost far from the $1,250 per tonne of capacity assumed here would move the replacement-cost leg directly, and with it the capital the terminal charges to keep the existing plants whole
Non-controlling interests are charged at their share of profit, not at book value	26.3% of total equity value is deducted for minorities in the bridge from enterprise to attributable equity, which is AED 1.81 under framing A. On a book basis (the balance-sheet carrying amount of $443.3m) the same framing gives AED 2.26	Minorities are large and concentrated in the two most profitable assets — 25% of the Egyptian producer and 49.01% of the Algerian one. They take a materially larger share of group profit than of group book equity, so charging them at profit share is the conservative reading and the one consistent with valuing the whole enterprise on its cash flows	A buy-out of either minority at a disclosed price, which would replace the estimate with a transaction. A reader who prefers the book convention can read the alternative directly from the bridge, which is published on both bases
The lower-carbon ammonia project is excluded from the base case	No cash flow, no capital and no value is carried for the one-million-tonne lower-carbon ammonia plant. It is named as an unpriced upside catalyst instead	The parent is warehousing the project and the company holds only an option to move to 54% ownership after completion, expected in 2027. An option that has not been exercised over an asset that is not consolidated is not a cash flow today, and modelling it would put the study's central figure at the mercy of an ownership decision the company has not taken	Exercise of the option, or any disclosure that fixes the terms and timing of the transfer. At that point it becomes a consolidated asset and belongs in the model
2026 is built as the reported half year plus a modelled second half	The disclosed first half — 2,571 kt of own-produced volume on $1,597m of segment revenue — is carried as fact, and only the second half is forecast	Half of the study year has already been reported. Carrying a modelled full year over a period the company has published would discard evidence that exists	Nothing — this is arithmetic, not judgement. It is listed because it explains why the 2026 column behaves differently from the four that follow

Judgement	What was chosen	Why	What would overturn it
Utilisation improves gradually rather than stepping up	Urea utilisation glides from 82.3% in 2026 to 88.8% by 2030; merchant ammonia from 71.5% to 84.7%. Installed capacity is held flat, because no additions are announced	The company runs a stated manufacturing improvement programme but gives no numeric volume guidance, so no guidance figure is carried. The glide is anchored on the 92% urea utilisation actually reported for the first half of 2026	An unplanned outage at either large plant, or a debottlenecking announcement that raises nameplate capacity. Utilisation is sensitised in the study and is the second most powerful driver after price
The third-party trading leg is carried at a segment margin, not built from unit economics	Traded volumes grow from 1,150 kt to 1,350 kt at a 7.5% margin on revenue — the one leg of the model that is not built from volume times price less cost per tonne. The gap is flagged rather than papered over	Volumes are disclosed by product but purchase-side unit economics are not disclosed anywhere, in any filing or presentation. A margin measured from disclosed segment earnings is the finest level the evidence supports	Any disclosure of purchase cost per tonne on traded product. The leg is small — it contributes a low-single-digit share of group earnings — so even a large error in it moves the value little
Working capital is projected from the conversion cycle, with the gas accrual removed	Receivable days of 64, inventory days of 63 and payable days of 82, all measured off the filed statements. Including the accrual would put payable days at 154 and make the cycle look permanently negative	The accrued gas catch-up is not a trade payable arising in the ordinary course; it is an unsettled liability with no payment schedule. Leaving it inside payables would show the company financing itself on supplier credit it has not actually negotiated	Settlement of the accrual on disclosed terms, which would convert it into either a cash outflow or a scheduled payable and put the question beyond judgement
The cost of capital is weighted by where the plants are, not by where the company is listed	The equity risk premium is 8.51% on a rating basis and 7.14% on a swap basis, blending each country's own published row at 50.9% UAE, 31.1% Egypt and 16.1% Algeria, weighted by disclosed non-current assets. Both bases are published	Treating an Abu Dhabi listing as an Abu Dhabi risk profile would have used 4.87% and ignored that nearly half the asset base sits in Egypt and Algeria. Country risk is counted once, inside the premium, and the risk-free rate is normalised by removing the same sovereign spread so it is not counted twice	A material change in the asset mix, or a sovereign rating action in any of the three countries. The weights come from a disclosed note and move with it
The cost of debt is the company's own marginal borrowing, not its accounting rate	5.67% — the dollar reference rate plus 0.975%, the average margin on the two most recent facilities the company actually drew. The 6.62% borrowing-cost capitalisation rate disclosed in the accounts is examined and not used	The capitalisation rate is a historical accounting average across a book that has since been repriced; the study needs the rate at which the next dollar is borrowed. The marginal rate is checked to sit above the Abu Dhabi sovereign, as a same-currency corporate must	A new facility at a materially different margin, which would be disclosed in the next borrowings note and would replace the figure directly
Terminal growth of 2.0% and a terminal debt weight of 20%	Cash flows grow at 2.0% after 2030 and the cost of capital glides from 11.90% to 11.11% as leverage normalises toward the sector. The terminal block is 56% of enterprise value under framing A	Two per cent is long-run dollar inflation with no real growth — appropriate for a mature plant base with no announced capacity additions. The debt weight is where merchant nitrogen producers actually run, above the company's currently light net leverage	A sustained change in the group's target capital structure, or evidence of real volume growth beyond debottlenecking. Growth is sensitised from 1.0% to 3.0% against the cost of capital in the study
The relative lens uses a multiple below the Gulf peers and above the European ones	5.8 times mid-cycle earnings before interest, tax, depreciation and amortisation of $1,191m, against a peer set trading from 5.2 to 10.4 times	The company earns Gulf gas economics but carries Egyptian and Algerian country risk, so it should not trade at either end of its own peer set. Mid-cycle earnings are the average of the last three forecast years under both price framings, so the multiple is not applied to a peak	A re-rating of the Gulf nitrogen names as a group, or a change in the country mix of the asset base. This lens is a cross-check and does not set the answer

Judgement	What was chosen	Why	What would overturn it
One lens is the answer; the others are cross-checks and are not weighted into it	The cash-flow lens is the answer, published as two framings rather than one number (AED 1.81 and AED 2.68). The enterprise multiple (AED 2.06) and book value (AED 1.27) sit beside it as cross-checks, the second of them a floor rather than a value. Normalised earnings power is not published as either	The unit economics are disclosed well enough to build the cash flow from the ground up, which is what makes it the answer rather than one input to an average. A weighted blend is a new method with weights nobody tested, and it imports the weakest lens at whatever number somebody typed — here it also averaged the two framings of the study's own central contested judgement, publishing a disagreement with the market that neither framing asserts. Book value is depreciated historical cost, the weakest guide to plants whose worth turns on a gas contract, so it is shown as a floor and never weighted	Evidence, out of sample, that some blend beats the primary lens alone. The lens values and both price framings are published separately, so a reader who wants a different answer can see exactly what it would be built from

What could not be sourced

Every category that was searched and produced nothing. Each says what was actually looked for, in which documents, and how the study handled the absence. They are recorded because an absence that is not written down becomes an assumption that nobody can see.

What was searched for, and where	Outcome	How the study handled it	Date searched
Impairments, discontinued operations, restatements or disposals — searched the FY2025 audited statements and both 2026 interim filings	Nothing found beyond the Wengfu Australia acquisition, which is disclosed and is not a base-resetting disposal	No adjustment. The historical series is used as filed, without normalisation for one-off items, because none were disclosed	2026-08-09
A purchase price, cost per tonne or gross margin per tonne on third-party traded product — searched the FY2023, FY2024 and FY2025 audited statements, both 2026 interim filings, every results report and the results-call transcript	Nothing found. Volumes are disclosed by product, but no purchase-side unit economics are given anywhere — only segment revenue and segment earnings	The trading leg is carried at a margin measured from disclosed segment earnings rather than built from unit economics, and is flagged in the study as the one leg not built from the ground up	2026-08-09
A delivered gas price per MMBtu for any period before the second quarter of 2026, and the Algerian and Egyptian gas pricing formulas themselves — searched all four audited filings, both interim filings and every results report	Nothing found. Only the single second-quarter 2026 figure given on the results call exists; no formula and no historical series is published	The cost relationship is calibrated from disclosed segment revenue and earnings across three periods, then checked against that one disclosed gas price and against gas consumption intensity per tonne. It is not built from a formula, because no formula is public	2026-08-09

A note on aggregator data, and one conflict between two company sources

No aggregator, data vendor, broker note or press report is the source of any figure the company itself has reported. Every historical income statement, balance sheet, cash flow, segment and note figure in this study comes from the audited annual filings and the reviewed interim filings listed above, and every recomputed subtotal was checked back against the filed figure it should equal.

The only aggregator-sourced items anywhere in the study are the peer enterprise multiples used in the relative lens — Nutrien, CF Industries, Yara International, OCI Global, Industries Qatar and SABIC Agri-Nutrients. They are market prices for other companies, not facts about this one, and they are labelled in the study as a cross-check on the cash-flow work rather than as an input to it. Benchmark product prices come from the company's own published tables, which cite the commodity price reporting agencies underneath them.

The one genuine conflict between two primary sources

The audited FY2025 segment note describes the gas offtake agreements as carrying "no/limited price exposure on the supply of natural gas". On the results call of 6 August 2026 the chief executive said the opposite in substance: that the company has "product-linked gas pricing effectively in both Egypt as well as Algeria. So, product prices are very strong. We'll see a higher gas cost." Both are company sources and they cannot both describe the same arrangement.

The study resolves the conflict in favour of the results-call statement, for three reasons. It is the more recent of the two, by five months. It is the more specific — it names the two countries and the direction of the effect, where the accounting note is a general characterisation written for a different purpose. And it is corroborated by two independent pieces of evidence: the delivered gas price the company disclosed for the second quarter of 2026 ($6 per MMBtu, or $8 including the Algerian profit-share) is far above what a fixed contract would imply, and the cost data itself, calibrated across three disclosed periods, tracks the product price with a fit of 0.960. The consequence is material and is stated plainly in the study: it converts the cost side of the model from an inflation-escalated stack into a function of the product price, which compresses the upside of high prices and cushions the downside of low ones. A reader who prefers the accounting note's characterisation should read the sensitivity table, where the relationship is priced from 0.30 to 0.65 of every dollar.
