

Independent Valuation Study — Educational Analysis

Elsewedy Electric Company S.A.E. (EGX: SWDY)

PRICE DATE 3 September 2026 — the latest known close, the price this valuation is measured against. ISSUE DATE 13 September 2026 — the day this edition was issued. A recalibration issues a new document carrying its own issue date; the two dates are stated separately because they are not the same fact.

Diversified industrial group — wires and cables, engineering and construction, electrical products, digital solutions and infrastructure investment · Egyptian Exchange · reporting currency EGP · analysis anchored on the closing price of 130.00 on 2026-09-03.

READ FIRST — what this document is. This is an educational valuation study. It contains no recommendation, no rating and no price target. What it contains is a fair-value range built from disclosed financial statements, a stated cost of capital, and explicitly listed assumptions — together with a separate, probabilistic map of where the share price could trade over the next one and three months. The two are different objects and are never blended.

What a fair value is not. A fair-value estimate is a statement about what the business appears to be worth on the assumptions set out here. It is not a forecast of the share price, and it carries no implied timeframe. A share can trade above or below an intrinsic estimate for years.

Where the numbers come from. Every figure traces to a source recorded in the accompanying source register: the company's own audited and interim financial statements and earnings releases, exchange filings, and named market data. Where a figure is derived rather than disclosed, it is labelled as derived and the derivation is shown.

The single largest uncertainty. This company earns just over half its revenue on a hard-currency-linked basis, but it reports, is listed and is financed in Egyptian pounds. The answer therefore depends heavily on which currency's cost of capital you believe applies. Both readings are computed and both are shown.

Headline

Elsewedy Electric is the largest listed industrial group on the Egyptian Exchange by revenue: EGP 281,049mn in FY2025, up +21% on FY2024 and +36% a year compounded over the last two years. It converts copper into cable, builds substations and power plants under turnkey contract, and sells meters, transformers and digital grid products across 15 countries. The company discloses exactly three reportable segments — Cables and its accessories, Constructions and infrastructure, and Electrical products and digital solutions — and just over half of group revenue is earned on a hard-currency-linked basis.

The operating story of the last two years is a margin normalisation, not a deterioration. The gross margin ran at 18.9% in FY2024 when a collapsing pound turned cheaply bought copper inventory into windfall profit; it settled to roughly 14.5% in FY2025 as that effect washed out. Revenue kept compounding through it. Net profit after minority interests was essentially flat at EGP 17,330mn against EGP 17,461mn — a flat result on a +21% revenue increase is the whole of the margin story in one line. The first quarter of 2026 reaccelerated: revenue EGP 75,298mn (+27%) and attributable profit EGP 4,845mn (+17%).

The balance sheet is not the constraint people assume. Gross borrowings are large because the working-capital cycle is large, but the group holds very substantial offsetting cash: net bank debt was EGP 20,560mn at the end of FY2025, only 0.7× EBITDA. And the debt is cheap in a way that is easy to miss: the audited notes disclose average rates of 21.3% on Egyptian-

pound liabilities but only 5.3% on the blended hard-currency book. The blended rate actually paid works out near 9.8%, less than half what a purely domestic Egyptian borrower pays.

On our primary construction the cash-flow lens — which is the answer here, not one vote of four — values the company at EGP 87.94 per share against a market price of 130.00 — the price sits about +48% above the central estimate. That gap is not mainly an argument about the business; it is an argument about the discount rate. Discounted at an Egyptian cost of capital gliding 26.7% to 15.3%, the cash flows support roughly EGP 87.94. Discount the hard-currency share of those same cash flows at a hard-currency cost of capital of about 11.3% and the same model produces EGP 77.86 — -40% against today's price, and -11% below the primary reading. So the currency lens does not explain the gap: it is the harsher of the two readings, and the market is paying more than either. Both are shown, and neither is hidden inside an average.

Valuation summary — every read at a glance

Read	Basis	Range (EGP/share)	Central	vs spot
Discounted cash flow	5-year FCFF, cost of capital gliding 26.7% → 15.3%, terminal growth 9%; 89% of enterprise value comes from the terminal value	46.85 – 133.83	87.94	-32%
Relative multiples	6.5× mid-cycle EV/EBITDA (trailing 10.5×; trailing P/E 16.1×)	66.40 – 99.61	79.68	-39%
Normalised earnings power	mid-cycle EBITDA margin 10.6% at a justified 9.0× P/E	79.91 – 132.54	103.30	-21%
Book value and sustainable return	justified price-to-book 1.9× on book value of 31.24/share at a sustainable return on equity of 23.5%	36.88 – 76.17	66.61	-49%
THE CENTRAL — the cash-flow lens, not an average	one class primary IS the central; the lenses above are cross-checks published at their own values, and the book lens is a disclosed floor that is never weighted	46.85 – 133.83	87.94	-32%
NOT AVERAGED — the retired blend, published unused	the retired weights: DCF 45% · relative 20% · normalised 20% · book 15%	—	86.16	-34%
Market price	closing price on the anchor date	—	130.00	—
ALTERNATIVE READINGS — separate questions, never averaged into the central				
Currency of discounting	the same cash flows with the hard-currency leg discounted at 11.3% instead of the Egyptian rate — a different view of country risk, not a fifth lens	—	77.86	-40%
Rating-basis cost of capital	the same model on the rating column of the published country-risk table rather than the market-spread column (see section 1.8)	—	68.18	-48%
Minority interests charged before net debt	an alternative sequencing of one line of the bridge (see section 1.8)	—	99.33	-24%

The alternative readings are shown so that each genuinely contested choice carries a number the reader can see, rather than being averaged silently into the headline. They are deliberately excluded from the central because each answers a different question — which currency's cost of capital applies, which column of a risk table to use, how to sequence one line of the bridge — and blending them would hide the disagreement instead of showing it. Ranges are

bear-to-bull within each lens; THE CENTRAL IS THE CASH-FLOW LENS ITSELF and its range is that same lens under its own two scenarios on one clock, not a spread across four methods. Those two scenarios move the cost of capital through the measured beta at its own 90% confidence bounds (1.504 in the bear and 0.945 in the bull, around an estimate of 1.225 with a standard error of 0.1699 on 256 weekly observations), not through a round number chosen by hand — so the width of the range is the width the estimate itself supports. Because this study takes the terminal beta to be 1.0, that whole interval reaches the explicit window only and is worth about 1.90 a share on its own; the rest of the span is the operating case — segment margins -12% to 12% against the adopted level, the currency path -6% to 8%, and the corporate cost load -0.5% to 0.5% of revenue — which are judged multipliers and are shown here as such. Terminal value is 89% of the discounted-cash-flow enterprise value — a high share, disclosed here and again in the bridge, and the reason the terminal assumptions are stress-tested in section 1.9.

Company overview — Elsewedy Electric at a glance

Item	Detail
Founded / listed	Established 1938 by the Elsewedy family; listed on the Egyptian Exchange as SWDY
What it does	Manufactures wires, cables and accessories; executes turnkey engineering and construction projects (substations, transmission and distribution, power generation, civil works); makes transformers, busway and electrical products; supplies meters and digital grid solutions; and holds infrastructure assets including industrial development, logistics, utilities and independent power projects
Scale	FY2025 revenue EGP 281,049mn across 31 production facilities in 15 countries. AN EXTERNAL REVIEW CHALLENGED THE HEADCOUNT THIS ROW USED TO CARRY — 'more than 20,000' — as understating the group several times over, and this study cannot settle it from anything it holds: no audited filing it reads discloses a headcount. What it CAN check points the same way. The same statements disclose a FY2025 wage bill of EGP 18,906mn across the three expense notes, which at 20,000 people would be EGP 945,290 a head — implausible for a group whose revenue is majority Egyptian. The figure is withdrawn rather than replaced with one this study has not sourced, and it is recorded as an open question. Nothing in the valuation reads it
Geographic mix	The audited FY2025 geographic note (Note 5-2) shows 40.7% of revenue booked outside Egypt — a statement about where the customer sits, not about pricing currency. Separately, this study derives the share that is hard-currency LINKED, i.e. dollar-priced, at about 51% using segment-level export-intensity weights of Cables 65% / Constructions 30% / Electrical products 45% (house judgements, stated so they can be disputed; the forecast-year share runs ~53% as Cables' weight in the mix rises); that is the figure used wherever the currency question is valued
Order book and volumes	Not disclosed in any of the audited FY2023-25 statements or the Q1-2026 interim. THE COMPANY DISCLOSES BOTH IN ITS OWN QUARTERLY EARNINGS RELEASES, and those releases are read. Engineering and construction backlog runs EGP 293bn at December 2025 and 346bn at 30 June 2026, with wires and cables 43.5bn and meters 8.8bn beside it; cable volumes run 144,997 / 156,748 / 167,665 / 185,449 tonnes over FY2022-25 and 99,239 in the reviewed half against 89,636. The volume series sets the Cables segment growth driver directly. The backlog is read and NOT burnt down: it corroborates the Constructions growth rate without producing it
Shares outstanding	2,141mn
Market capitalisation	EGP 278,301mn at the anchor price
Ownership	El Sewedy family ~68.0% · Electra Investment Holding 18.9% · free float ~13.1%, per the audited FY2025 shareholder table. Electra, an Abu Dhabi holding vehicle, acquired 20.0% in a July-2024 tender offer at USD 1.05 per share (~USD 449mn) and topped up to 20.4% by FY2024-end; over 2025 it SOLD roughly 32.1mn shares into the market, taking its stake to 18.9% — a disposal, not dilution: the share count is unchanged. The 13.1% 'other shareholders' line is an upper bound on the true free float, since family-linked vehicles may sit inside it
Net bank debt	EGP 20,560mn at 31 December 2025 (0.7× EBITDA), computed from the audited balance sheet: loans and borrowings including leases 62,509 less cash 41,949. The company's own FY2025 earnings release quotes EGP 19,789mn on its own narrower basis; the audited-statement computation is used, and the 771mn definitional gap is noted rather than resolved
Last strategic transaction	Electra Investment Holding's tender offer concluded July 2024: 428mn shares (20.0%) at USD 1.05, about USD 449mn — roughly EGP 50 per share at the rate then prevailing. Recorded because it is the last price at which a strategic buyer cleared a fifth of the

	company, but NOT used as a valuation anchor: it is two years stale, struck before the earnings base grew by about half, and sits at under half today's price
Dividend record	EGP 1.00 per share on the FY2024 result (12.3% of attributable profit), then EGP 1.85 on FY2025 — ratified by the general assembly on 6 May 2026, rights with the share through 1 June, paid from 4 June 2026 — 22.9% of FY2025 attributable EPS, an +85% step-up. An earlier revision of this study wrongly stated no FY2025 dividend existed, reasoning from the silence of the annual and interim filings; the interim covers a period ending before the assembly met, so its silence was never evidence. The forecast payout ratio is 25%, struck at the actual FY2025 rate

Two structural facts govern everything that follows. First, the revenue base is just over half hard-currency linked while the share, the accounts and the borrowing are Egyptian — so the company is a natural hedge against the currency its shareholders are exposed to. Second, the business consumes working capital in direct proportion to its growth: inventories, contract assets and receivables less payables and contract liabilities ran at 24.1% of revenue in FY2023, 23.1% in FY2024 and 19.9% in FY2025. In FY2025 the group earned EBITDA of EGP 28,363mn and converted only EGP 12,766mn of it into operating cash after interest and tax (45.0%). Growth here is expensive, and that is the crux of the valuation.

1 Fundamental valuation

1.1 The cash-flow model — the primary lens, with the full waterfall

The primary lens is a five-year free-cash-flow-to-the-firm model. Revenue is not forecast as a single growth rate applied to a revenue line: it is built from the three segments the company itself discloses — Cables and its accessories, Constructions and infrastructure, Electrical products and digital solutions — each grown and margined on its own driver, then summed. The group EBITDA margin is therefore an OUTPUT of the build — of the segment mix and the corporate cost load — rather than an assumption fed into it. The three SEGMENT margins are inputs and are stated as such: each is FY2025's own level plus the like-for-like change the reviewed half measured, held flat across the window, and the alternative of taking the half's LEVEL instead is priced in section 1.9. The historical version of that build reconciles to the audited income statement EXACTLY on revenue historical version of that build reconciles to the audited income statement EXACTLY on revenue in all three years (Note 5-3) and to the audited operating profit through an explicit, exactly-reconciling corporate cost load (Note 16 less G&A, net impairment on receivables, other expenses and other income). Section 1.6 sets out the segment build. Cash flow is then taken all the way to present value, line by line, below.

EGP mn	FY26E	FY27E	FY28E	FY29E	FY30E
Revenue	370,194	449,226	514,907	579,202	645,083
of which domestic	180,311	219,444	252,847	284,451	315,251
of which foreign	189,882	229,782	262,061	294,751	329,832
EBITDA	38,286	47,221	54,802	62,040	69,157
EBITDA margin	10.3%	10.5%	10.6%	10.7%	10.7%
Less depreciation and amortisation	(3,961)	(4,807)	(5,510)	(6,197)	(6,902)
EBIT	34,325	42,414	49,293	55,843	62,254
NOPAT — EBIT × (1 – 24.5%)	25,916	32,022	37,216	42,161	47,002
Add back depreciation and amortisation	3,961	4,807	5,510	6,197	6,902
Less capital expenditure	(13,232)	(16,056)	(18,404)	(20,702)	(23,057)
Less change in working capital	(16,965)	(15,546)	(12,920)	(12,647)	(12,959)
Free cash flow to the firm	-319	5,227	11,402	15,010	17,889

Forward cost of capital	26.7%	22.9%	19.7%	17.2%	15.3%
Discount factor	0.7896	0.6425	0.5366	0.4578	0.3969
Present value of FCFF	-252	3,359	6,119	6,871	7,099

Every line is computed, not typed: the waterfall runs EBITDA → depreciation and amortisation → EBIT → NOPAT → add back depreciation → less capital expenditure → less the change in working capital → free cash flow to the firm → discount factor → present value. Working-capital change is the difference in net working capital held at a constant 19.7% of revenue, the level the audited balance sheets actually show.

The valuation, on one page

EGP mn	FY26E	FY27E	FY28E	FY29E	FY30E
Revenue	370,194	449,226	514,907	579,202	645,083
EBITDA	38,286	47,221	54,802	62,040	69,157
Less: cash taxes	-8,410	-10,391	-12,077	-13,682	-15,252
Less: capital expenditure	-13,232	-16,056	-18,404	-20,702	-23,057
Less: investment in working capital	-16,965	-15,546	-12,920	-12,647	-12,959
Free cash flow to the firm	-319	5,227	11,402	15,010	17,889
Discount rate for the year	26.65%	22.88%	19.74%	17.23%	15.34%
Discount factor	0.7896	0.6425	0.5366	0.4578	0.3969
Present value of free cash flow	-252	3,359	6,119	6,871	7,099

The bridge to value per share	EGP mn
Sum of present values, explicit window	23,195
Terminal value, undiscounted	493,872
Present value of the terminal value	195,998
Terminal value as a share of enterprise value	89.42%
Cost of capital, first explicit year	26.65%
Cost of capital, terminal	15.34%
Terminal growth	9.14%
ENTERPRISE VALUE	219,193
Less: net debt	-20,560
Add: investments in associates	6,758
Less: minority interests	-19,872
Less: employees' statutory share of profit	-22,620
EQUITY VALUE	162,899
Shares in issue (mn)	2,141
Value per share at the model date	76.09
VALUE PER SHARE	87.94

Every line is read from this study's own committed numbers, not recomputed for the table: the present values sum to the enterprise value above them, and the bridge runs to the value per share the rest of this document carries. Free cash flow is NEGATIVE in the first forecast year — revenue grows by more than a third and working capital absorbs 16,965 against capital expenditure of 13,232 — which is what growth costs a working-capital-heavy industrial and is not a distress signal. The terminal value is 89.4% of enterprise value, so the two lines under it deserve the sensitivity that follows.

The two numbers the answer turns on

EGP / share — terminal cost of capital (down)	7.14%	8.14%	9.14%	10.14%	11.14%
---	-------	-------	-------	--------	--------

vs terminal growth (across)					
13.34%	104.21	116.81	135.22	164.88	221.10
14.34%	87.87	95.97	107.03	123.17	149.15
15.34%	75.53	80.93	87.94	97.51	111.45
16.34%	65.90	69.58	74.17	80.14	88.25
17.34%	58.17	60.70	63.77	67.60	72.54

Terminal cost of capital down the side, terminal growth across the top, both stepping around the adopted case. THE CENTRE CELL IS THE STUDY'S OWN ANSWER — EGP 87.94 — so the reader can locate the struck number on the grid and read the cost of being wrong in either direction from it. A one-point move in the terminal cost of capital is worth more than a one-point move in terminal growth, which is the usual shape when the terminal carries most of the value.

The bridge from enterprise value to the equity — and to the anchor date

Step	EGP mn	Note
Present value of the five forecast years	23,195	sum of the present-value row above
Terminal-year free cash flow	28,072	NOT a reinvestment-rate identity. FY2030E NOPAT of 47,002 — the last forecast year's, NOT grown, because the capitalisation below grows the finished cash flow one year and growing it here as well would overstate the terminal by a full year — plus book depreciation of 6,902 added back, LESS maintenance at replacement cost 12,377 on the derived 17.26-year asset life, less growth capital 4,573 at the stated real terminal growth, less inflation on working capital 8,882 — so the terminal pays for replacing its own assets at what they cost to replace, not at what they cost historically. The retired construction forced reinvestment to $g \div \text{terminal return on capital}$ (22.4%) and is published beside the model, unused
Present value of the terminal value	195,998	the terminal cash flow grown one year and capitalised at 15.34% – 9.14%, then discounted at the year-5 factor 0.3969. IT REPRODUCES FROM THE ROW ABOVE: $28,072 \times 1.0914 \div 6.2035\% = 493,872$, and $493,872 \times 0.3969 = 195,998$
Enterprise value	219,193	the two lines above
Terminal value as a share of enterprise value	89%	disclosed here and in the summary table; stress-tested in section 1.9
Less net bank debt	(20,560)	audited, at 31 December 2025
Plus equity-accounted investees	6,758	audited FY2025 carrying value, no uplift; these earn outside the consolidated cash flow
Less minority interests	(19,872)	minorities take 9.7% of group profit, so they are charged the same share of the value
Less the employees' statutory share of distributable profits	(22,620)	Egyptian company law gives employees a share of DISTRIBUTABLE PROFITS. This study does not compute that statutory base — it is struck at the company level and the filings do not publish it — so the 12.2% carried here is not the statutory percentage. It is the OBSERVED RATIO the disclosure itself reports the charge at: the mean of the charge over profit attributable to owners across FY2024, FY2025 and H1-2026, carried forward on the assumption that the relationship between the two bases holds. Stated because the difference matters to a reader checking the law: the base in the statute and the base in this row are not the same quantity, and earlier editions of this table named only the second while citing the first. The charge is disclosed only in the earnings-per-share note, below the attributable line, and appears in no line of the income statement. The statutory share is capped at total annual wages, and that cap does not bind: the wage bill is disclosed in three notes of the same

		audited statements at EGP 18,906mn against a statutory share of EGP 2,073mn, so the charge sits at 9.1x of headroom. It is the measured charge, not an upper bound
Equity attributable, at 31 December 2025	162,899	EGP 76.09 per share — dated at the audited balance-sheet date the bridge subtracts net debt at
Rolled 246/365 of a year to the anchor	×1.1816	fair value accretes at the 28.1% cost of equity between the valuation date and the 2026-09-03 anchor — one date, one price of time, applied to the comparison itself
Less the FY2025 dividend paid in the window	(1.97/sh)	EGP 1.85 went ex on 4 June 2026 — value that left the share before the anchor. It is deducted AT THE ANCHOR, not at its ex-date: carried forward the 91 days to 2026-09-03 at the 28.1% cost of equity the rest of the roll uses, it is EGP 1.97. Deducting the raw 1.85 against a value rolled the whole way would credit the share with earning a return on money it had already paid out
Fair value per share at the anchor (EGP)	87.94	against a spot of 130.00 (-32%)

Every lens in this study — not only the cash-flow model — is rolled to the anchor on the same two lines, so no value dated 31 December 2025 is ever compared to an August price. An earlier revision omitted the roll; an external review correctly flagged the omission as a breach of the study's own one-date rule, worth about seven months of accretion on the primary lens.

1.2 Book value and sustainable return — the asset lens

Book value attributable to shareholders is EGP 66,871mn at the audited FY2025 close, or 31.24 per share. The trailing return on average equity is 28.4%. That number is flattered: FY2023 and FY2024 both carried devaluation gains on copper inventory bought before the pound moved, so the sustainable rate is struck lower, at 23.5%.

A justified price-to-book multiple is $(\text{return on equity} - \text{growth}) \div (\text{cost of equity} - \text{growth})$. It is priced at the PERPETUAL (terminal) cost of equity of 16.9% — a steady-state multiple takes a steady-state rate, not a five-year transitional one. (An earlier wording called this figure an 'average' of the two windows, which it never was; the actual average, 22.5%, is the construction behind this lens's published bear bound of 36.88.) That gives 1.9× book, or EGP 66.61 per share at the anchor. This is the weakest of the four lenses for this company — it is published as a disclosed FLOOR and is never weighted, because nothing here is weighted — for a specific reason: three years of currency translation have moved reported book value in ways that have little to do with the earning power of the assets, and a group whose value sits in an order book and a brand is poorly described by its balance sheet. It is retained because it is the lens that disagrees most, and a lens that only ever agrees is not doing any work.

1.3 Relative multiples

Measure	Value	Comment
Enterprise value / EBITDA (trailing)	10.5×	enterprise value 298,861 over FY2025 house EBITDA 28,363 (EBIT + D&A). Two base notes: this trailing EV is market cap plus net debt WITHOUT the associates/minority adjustments the justified multiple below carries — a simpler market-observable convention, labelled as such; and on the company's own published non-GAAP EBITDA (a different, larger definition) the multiple would be lower
Price / earnings (trailing, attributable basis)	16.1×	price 130.00 over attributable earnings per share of 8.10
Price / earnings (trailing, as-reported basis)	18.2×	the company's own reported earnings per share is struck after the Egyptian employee and board profit-share appropriation, so screens and data vendors show this higher multiple. Both are given because a reader comparing against a screen will see the second

Price / book	4.2×	book value 31.24 per share
Net bank debt / EBITDA	0.7×	light net leverage against a large gross book
Justified enterprise value / EBITDA	6.5×	applied to FY2027E EBITDA and then DISCOUNTED BACK two years, because a forward multiple produces a forward enterprise value. The multiple is set below the company's own trailing multiple as an Egyptian-market discount. NOTE: no peer multiple is computed anywhere in this study, so this is a judgement anchored on SWDY's own trading history, not a peer-derived figure — an earlier draft asserted a "peers trade at 8-11x" range that was not supported by any calculation, and it has been withdrawn
Plus interim cash flows	3,106	the present value of the FY2026-27 free cash flows the forward multiple does not capture. NET POSITIVE: FY2026 consumes working capital and its present value is -252, but FY2027 contributes 3,359 and the second outweighs the first. Added after external review; omitting it had UNDERSTATED this lens
Implied value per share, at the anchor	79.68	bear 66.40 at 5.5× / bull 99.61 at 8.0×; rolled to the anchor date on the same two lines as the cash-flow bridge

Two things about this lens should be read before its number is. First, applying a multiple to a forecast year gives an enterprise value AS AT that year; it has to be discounted back before it can be compared with today's price. Not doing so would have produced EGP 145.72 per share instead of 79.68 — a EGP 66.03 overstatement, which an earlier draft of this study contained. Second, the justified multiple is a judgement, not a peer-derived figure.

The honest difficulty with this lens is that there is no clean comparable. The nearest listed regional peer in cables is a Saudi manufacturer with a fraction of the revenue, no turnkey contracting arm and a very different balance sheet; the global cable majors are European and carry neither Egyptian sovereign risk nor Egyptian growth. Applying a discounted multiple to mid-cycle EBITDA is therefore a sanity check on the cash-flow model rather than an independent valuation, and it is weighted accordingly.

1.4 Normalised earnings power — mid-cycle margin at current scale

The question this lens asks is what the group earns at its CURRENT scale in a year that is neither a currency windfall nor a margin trough. The mid-cycle EBITDA margin of 10.6% — the FY28E point of the forecast, comfortably below the FY2024 outturn of 13.6% and above the FY2025 trough of 10.1% — is applied to FY2026E revenue of EGP 370,194mn. An earlier revision applied the multiple to FY2028-SCALE earnings with no time value, injecting two years of undiscounted growth into a present-day lens; an external review flagged it correctly and the construction was restated. The retired construction is published beside the model rather than described: see the lens record, which carries what it returned and what the restatement cost.

Step	EGP mn
Current-scale (FY2026E) revenue	370,194
Mid-cycle EBITDA margin (FY28E) at 10.6%	39,400
Less depreciation and amortisation	(3,961)
Mid-cycle EBIT	35,439
Less net interest (FY2026E)	(1,743)
Plus share of equity-accounted investees (FY2026E)	1,694
Less tax at 24.5% and minority interests at 9.7%	(14,198)
Normalised attributable earnings	21,192
Normalised earnings per share (EGP)	9.90

At a justified 9.0× price/earnings, rolled to the anchor (EGP per share)

103.30

Bear 79.91 at 7.0× and bull 132.54 at 11.5×, both rolled to the anchor date like every other lens. Every input row is the figure the computation actually uses — the associate line is the FY2026E forecast, not the FY2025 actual. One disclosed conservatism: equity-method associate income is taxed at 24.5% inside this lens although it arrives already post-tax at the investee — worth 2.06 a share on THIS lens if removed, computed rather than estimated (an earlier edition of this sentence said about +0.4, which understated it roughly fivefold: this is an earnings lens, so the multiple applies to the relieved earnings too). The justified multiple is held well below what a comparable industrial franchise would attract in a developed market, because an Egyptian cost of equity near 28% mathematically compresses what any stream of earnings is worth.

1.5 Synthesis — one lens is the answer, the rest are cross-checks

Figure 1 — the four lenses against the market price of 130.00. Each bar is that lens's bear-to-bull span; the brass tick is its base case.

Lens	Bear	Base	Bull	Role	vs price
Discounted cash flow (the answer)	46.85	87.94	133.83	THE ANSWER	-32%
Relative multiples	66.40	79.68	99.61	cross-check	-39%
Normalised earnings power	79.91	103.30	132.54	RETIRED for this class — computed and shown, never weighted	-21%
Book value and sustainable return	36.88	66.61	76.17	a floor, never weighted	-49%
THE CENTRAL — the cash-flow lens, not an average	46.85	87.94	133.83	the class primary	-32%
NOT AVERAGED — the retired blend, published unused		86.16		retired	-34%

The four lenses do not agree, and the disagreement is informative rather than embarrassing. The two lenses that look at earnings — relative multiples and normalised earnings power — land near or slightly above the market price. The two that discount cash or capital at an Egyptian cost of capital land well below it. This is the same disagreement in two forms: a multiple imported from a market with a low cost of capital implicitly assumes a low cost of

capital, and a discounted model applied with an Egyptian one does not. THE CENTRAL DOES NOT SIT BETWEEN THEM: it is the cash-flow lens itself at EGP 87.94, and the market-anchored reads are published beside it at their own values so a reader can judge the disagreement rather than receive a number in which it has already been settled by a weight. An earlier edition did settle it that way and reported EGP 86.16, -34% against the price where this study holds -32%.

1.6 The drivers — the three disclosed segments, each grown on its own driver

Revenue is not forecast as a single growth rate applied to a revenue line. The company discloses exactly three reportable segments — Cables and its accessories, Constructions and infrastructure, and Electrical products and digital solutions — with revenue by segment (Note 5-3) that reconciles EXACTLY to consolidated revenue in every one of the three audited years, and segment profit (Note 16) that reconciles to consolidated operating profit through an explicit corporate cost load. None of the three audited filings, including the Q1-2026 interim, discloses a tonnage, unit-volume or order-book figure for any segment. The company's own quarterly earnings releases DO, and they are read: Cables is built as a unit model on the disclosed tonnage series times a copper and currency pass-through measured out of that segment's own audited revenue per tonne — 55.4% of FY2025 revenue. Constructions and Electrical products have no unit in any source, so they taper on their own recent revenue growth and margin path. THE SEGMENT MARGINS ARE INPUTS in all three, not outputs: each is a constant held flat across the window, set at FY2025's level plus the reviewed half's like-for-like change (cabl 11.43%, cons 8.99%, elec 23.62%). Only the group EBITDA margin is an output, and only of the mix. This is the largest single lever in the study and section 1.9 prices both sides of it.

The three disclosed segments, historically

Segment	FY2023 revenue	margin	FY2024 revenue	margin	FY2025 revenue	margin
Cables and its accessories	82,421	19.5%	137,190	18.1%	155,793	13.5%
Constructions and infrastructure	53,483	11.6%	70,921	11.4%	90,959	6.5%
Electrical products and digital solutions	16,282	25.4%	23,871	26.6%	34,298	22.2%
Group revenue	152,186		231,982		281,049	

Segment revenue (Note 5-3) sums to consolidated revenue exactly in every year shown — there is no elimination or apportionment. Segment margin is segment profit (Note 16, inside- and outside-Egypt columns summed) divided by this same revenue base. Every segment compressed from FY2023 to FY2025; Cables and Constructions compressed the most, Electrical products the least.

How the forecast is driven

Driver	FY2025 base	FY26E	FY27E	FY28E	FY29E	FY30E
Copper (USD/tonne)	10,000	13,400	14,350	14,709	15,076	15,453
USD/EGP average rate	47.7	54.0	59.0	62.7	65.8	68.7
Cables — FY2026 growth, MEASURED on the reviewed half	—	30.57%	—	—	—	—
Cables — tonnage growth (the disclosed volume driver, FY2027-30)	—	—	9.0%	7.5%	6.5%	5.5%
Cables — copper/FX pass-through to revenue (FY2027-30)	—	—	-6.5%	-4.4%	-2.2%	nil
Cables — segment margin	13.5%	11.4%	11.4%	11.4%	11.4%	11.4%

Constructions and infrastructure — revenue growth	—	27.4%	20.0%	15.0%	11.5%	9.0%
Constructions and infrastructure — segment margin	6.5%	9.0%	9.0%	9.0%	9.0%	9.0%
Electrical products and digital solutions — revenue growth	—	48.3%	33.0%	23.0%	16.0%	11.0%
Electrical products and digital solutions — segment margin	22.2%	23.6%	23.6%	23.6%	23.6%	23.6%
Corporate cost load, segment profit → EBIT basis (% of revenue)	3.2%	3.1%	3.1%	3.1%	3.1%	3.1%
Capital expenditure (% of revenue)	4.7%	3.57%	3.57%	3.57%	3.57%	3.57%
Depreciation and amortisation (% of revenue)	1.1%	1.1%	1.1%	1.1%	1.1%	1.1%

Copper is carried forward at the current market level IN REAL TERMS rather than forecast: 13,400/t in FY2026 and the level thereafter escalated at the house's own US long-run inflation, reaching 15,453/t by FY2030E. Earlier editions called this 'held flat' and held the dollar price flat in NOMINAL terms, which is a real decline of about a tenth across the window — a directional view on the metal arrived at by leaving a number alone. A directional view would dominate the valuation, and it is carried in the sensitivity instead. Cables grows on DISCLOSED TONNAGE — 185,449 tonnes in FY2025 from the company's own quarterly releases, a 8.5% three-year compound rate — times a copper and currency pass-through measured out of the segment's own audited revenue per tonne, rather than on a revenue growth assumption. The audited statements disclose no tonnage for any segment; the releases are the issuer's own and are cited as such. Constructions and Electrical products taper on their own FY2023-25 revenue CAGR. The corporate cost load — stated on the same segment-profit-to-EBIT basis as the audited history (5.70% / 4.30% / 3.16%) — is HELD FLAT at 3.07% in every forecast year, slightly BELOW FY2025's own 3.16% — the reviewed half measures the level holding rather than reverting, and the forecast follows the measurement. THIS IS THE STUDY'S MOST CONSEQUENTIAL CONTESTED JUDGEMENT AND IT IS PUBLISHED BOTH WAYS: the retired reversion path (4.55% / 4.65% / 4.75% / 4.75% / 4.85%) gives EGP 54.00 a share, -39% against the central. The capex and D&A paths are shown because they are live free-cash-flow drivers, not footnotes: capex is held at a flat 3.57% of revenue, the rate measured off the completed 2024-25 programme (it ran 3.1% in FY2023, 3.7% in FY2024 and peaked at 4.7% in FY2025). Holding it at that FY2025 peak instead would cost EGP 8.29 on the cash-flow lens, taking it to 79.65 — an earlier edition of this caption put that cost at 1.8 and was wrong by a factor of 4.6.

What the build produces — margins as outputs

EGP mn	FY26E	FY27E	FY28E	FY29E	FY30E
Revenue	370,194	449,226	514,907	579,202	645,083
Segment profit (Note 16 basis)	45,690	56,205	65,101	73,624	82,058
Segment profit margin	12.3%	12.5%	12.6%	12.7%	12.7%
Less corporate cost load (to EBIT)	(11,365)	(13,791)	(15,808)	(17,781)	(19,804)
EBIT	34,325	42,414	49,293	55,843	62,254
Add back depreciation and amortisation	3,961	4,807	5,510	6,197	6,902
EBITDA	38,286	47,221	54,802	62,040	69,157
EBITDA margin	10.3%	10.5%	10.6%	10.7%	10.7%

THE FY2026 BUILD IS CALIBRATED ON THE REVIEWED HALF TO 30 JUNE 2026, not merely checked against it: all three segment growth rates are that half's own year-on-year ratios (cables 30.57%, construct 27.44%, elecprod 48.28%), all three margins are FY2025 plus its like-for-like change, and working capital and capital expenditure are re-anchored on it. The Q1-2026 gross-up is therefore NOT an independent check — it is a quarter of the period the build stands on — and it is shown for continuity rather than as corroboration: the disclosed Q1-2026 revenue of 75,298, grossed up on the Q1-2025 seasonal share of FY2025, implies a full FY2026 of roughly 356,323 against the build's 370,194, a +4% difference. That quarter reported revenue +27% and attributable profit +17% year on year.

Figure 2 — revenue by currency of origin with the EBITDA margin path. The hard-currency leg does the growing; the margin recovers gently as the copper-price inflation of 2024–25 washes out of the revenue denominator.

The segment mix, FY2025 against FY2030E

Segment	FY2025 revenue (EGP mn)	Share	FY2025 margin	FY2030E revenue (EGP mn)	FY2030E share
Cables and its accessories	155,793	55.4%	13.5%	343,539	53.3%
Constructions and infrastructure	90,959	32.4%	6.5%	194,420	30.1%
Electrical products and digital solutions	34,298	12.2%	22.2%	107,125	16.6%
Group	281,049	100.0%	12.3%	645,083	100.0%

FY2025 figures are the audited Note 5-3 / Note 16 disclosures directly; nothing is apportioned or calibrated. By FY2030E Cables' share of revenue rises from 55.4% to 53.3% as it compounds on copper and FX; Constructions' share falls as its growth tapers fastest.

1.7 The crux — working capital first, the currency second, margins third

The FY2025 accounts contain the single most important number in this study. The group earned EBITDA of EGP 28,363mn and generated operating cash flow, after interest and tax, of EGP 12,766mn — about 45% of it. The difference went into working capital, though FY2025 was genuinely the best of the three audited years on this measure: net working capital fell from 23.1% of revenue in FY2024 to 19.9% in FY2025, even as revenue grew +21%.

Working capital	FY2023	FY2024	FY2025
Inventories	30,882	56,796	59,860
Contract assets	16,180	18,052	29,895
Trade and other receivables	46,592	86,736	116,260
Less trade and other payables	(31,938)	(54,808)	(68,896)
Less contract liabilities	(25,060)	(53,281)	(81,266)
Net working capital	36,655	53,495	55,853
As a share of revenue	24.1%	23.1%	19.9%

The segment build makes a second point that a percentage-of-revenue model hides. Copper is passed through in Cables: a higher copper price raises revenue without raising the profit earned on it. But working capital scales with revenue, so a copper spike CONSUMES cash while

adding almost no profit. That is visible in FY2026E, where revenue rises +32% — much of it copper and FX translation — and the resulting EGP 16,965mn working-capital build cuts free cash flow to the firm to just EGP -319mn, against EGP 5,227mn the following year once the step-up is absorbed. A rising copper price is not good news for this business in the year it happens.

The model holds this ratio near 19.7% of revenue, the FY2025 disclosed level. That single assumption is worth a great deal: every percentage point of revenue added to or removed from working-capital intensity is worth roughly EGP 2.87-3.67 per share (the local slope at the base and the average across the tested 17%-23% span). If the group converts working capital further — collecting faster, or pushing more of the funding onto suppliers and customers — the cash-flow model reprices sharply upward. If FY2025's improvement reverses, it reprices down just as fast.

1.8 Macro and country — rates, the pound, and the sourced cost of capital

The discount rate is a schedule, not a number. Each forecast year is discounted at that year's own forward rate, moving from the explicit-window rate to the terminal rate; the terminal value is capitalised at the terminal rate and brought back using the same cumulative factor as the year-5 cash flow. One date, one price of time — the terminal value never gets a cheaper discount than a cash flow arriving on the same day.

Component	Explicit window	Terminal	Source and construction
Risk-free rate	22.3%	10.5%	observed 10-year local-currency government yield, carried at the 2026-07-21 print (cached, re-verified 05-Aug-2026) and NOT read on the 2026-09-03 anchor date, which is 44 days later; the row below prices what a 100bp move is worth. Readings of the same instrument span roughly 22.3%-23.0% across sources and disagree; the adopted point sits at the low end and the rate is carried in the sensitivity. Terminal = 7.0% long-run Egyptian inflation READ FROM THE HOUSE MACRO PATH plus a 3.5% real-rate convention = 10.50%. It is the same inflation the terminal growth rate of 9.14% is derived from, by construction rather than by coincidence — a discount rate and a growth rate built on two different inflations would be a free lunch of two points in perpetuity
Less sovereign default spread	(3.4%)	—	the hard-currency CDS spread, netted from the local yield and then re-entering, volatility-scaled, through the country premium inside the ERP. The NET country charge through the equity channel is therefore about +1.9pp, not zero — stated plainly, since an earlier wording implied the netting removed the charge outright. The un-netted construction (cost of equity 33.8%) is retired but retained in the audit trail
Adjusted risk-free rate	18.9%	10.5%	
Beta	1.225	1.000	explicit window: own-stock weekly regression against the published EGX30 index of the exchange this share is listed on, over 4.94 years: R-squared 0.368, n = 256, standard error 0.170, 90% interval [0.95, 1.50]. Terminal: beta is carried to 1.00 rather than held at the measured figure — today's relative risk is not a property of the company in perpetuity, and the construction is named in the cost-of-capital record as beta_to_one_split
Equity risk premium — mature-market leg (beta applies HERE, and only here)	4.24%	4.24%	the mature-market equity risk premium out of the published country-premium file (January-2026 vintage). This is the only leg the beta above multiples
→ beta × the mature leg	5.20%	4.24%	the product of the two rows above it
Country premium — levied FLAT, never	3.98%	2.13%	Egypt's home premium of 5.17% weighted at 0.5928 for the share of operations inside Egypt, blended with a 2.26%

multiplied by beta			premium on the rest. Charging a 1.22-beta company 22% more country risk than the market is a separate claim and this study does not make it
Total premium charged (the two legs above)	9.18%	6.37%	for comparison, the undivided published premium is 9.4% on the credit-default-swap basis; multiplying THAT by beta is the retired construction and gives a cost of equity of 33.8%
Cost of equity	28.1%	16.9%	the adjusted risk-free rate plus the two premium legs above — and the rows of this table now reach it: 18.91% + 5.20% + 3.98% = 28.09%
Cost of debt (blended, pre-tax)	9.5%	8.9%	currency-blended — see the evidence immediately below. 9.5% is the FY2026 forward point of the disclosed cost-of-debt path under the central bank's easing cycle; the FY2025 trailing effective rate was 9.8%, and the integrity gate bounds the two against each other
Cost-of-debt path (drives the glide)	9.5% / 8.9% / 8.4% / 8.0% / 7.7%	—	the forward rates whose cumulative progress sets the glide fractions between the explicit-window and terminal cost of capital — published so the three intermediate discount rates are reproducible
Debt weight	6.9%	15.0%	net debt against market capitalisation for the explicit window; a normalised 15% for the terminal — REVISED from 25% after review showed the old weight contradicted the model's own forecast deleveraging in the direction that flattered the valuation; worth about -2.4 on the cash-flow lens
Cost of capital	26.7%	15.3%	

Discounting is end-of-year discrete (each year's flow at its full-year factor) — the conservative convention; mid-year discounting would raise the explicit strip by 8.6%, computed by re-discounting the same five flows half a year earlier rather than estimated in prose. All values are then rolled to the 2026-09-03 anchor as shown in the bridge.

The cost of debt — three pieces of evidence, not an assumption

A disclosed contractual range is not evidence of what a company pays. Three things are shown instead.

Test	Evidence
Currency composition of the debt book	The audited FY2025 interest-rate note discloses average rates of 21.3% on Egyptian-pound financial liabilities and 5.3% on the blended hard-currency book (the note moved from a three-way EGP/USD/EUR split in FY2024 to this simpler two-way format in FY2025). Reconciling those against the rate actually paid implies roughly 28% of the book is in Egyptian pounds and 72% in hard currency — DOWN sharply from the 44% pound share implied a year earlier, as hard-currency facilities were drawn down further. Treating this company as a domestic borrower would overstate its cost of debt by about 1,146 basis points.
Independently computed effective rate	FY2025: interest expense on loans and credit facilities of 5,967 against the average of the opening and closing balance (58,797 and 62,462) = 9.8%.
Bounds	The adopted 9.5% sits within 34 basis points of the independently computed effective rate and does not exceed it by more than 50 basis points. Both bounds hold.

This is not a technicality. A cheap, majority-hard-currency debt book is one of the two genuine competitive advantages this company has over a domestic-only competitor — the other being that its revenue is hard-currency linked too. It is also why the balance sheet looks more leveraged than it is: the gross book is large because working capital is large, but it costs roughly 9.8% and is more than two-thirds offset by cash.

Where this construction is contested, and what the alternatives are worth

Six choices in the construction above are legitimately arguable, and external reviewers have argued them. Rather than defend each in prose, each alternative is computed and its value published here, so a reader who prefers a different convention can take the number directly.

Choice made	The alternative	Fair value on the alternative	Why we keep ours
Equity risk premium on the credit-default-swap basis (9.4%), with the sovereign spread netted at 3.4%	The rating basis from the same published table: spread 6.4%, premium 13.9%, cost of equity 27.8%	EGP 68.18 (against 87.94)	Both are columns of the same published source. The market-observed basis is preferred to the agency-rating basis, which lags. This is the single largest open question in the cost of capital and the alternative is worth roughly 19.77 per share
Minority interests charged against consolidated equity, after net debt	Charged against unlevered enterprise value, before net debt	EGP 99.33 (11.39)	The audited borrowings note records facilities granted to the company AND its subsidiaries, guaranteed by promissory notes from subsidiaries — so minorities do bear a share of the debt. The alternative assumes all borrowing sits at the parent, which the note contradicts
Capital weights on net debt	On gross debt (18.3% weight, cost of capital 24.3%)	EGP 92.18 (4.24)	Net debt is the quantity the bridge subtracts; using it in both places keeps the two consistent, and it is the more conservative of the two
Cost of debt on currency composition (9.5%): the disclosed coupon on each currency leg, unadjusted	EGP-equivalent (15.5%): the hard-currency legs loaded with the pound's own 7.6%/year forecast depreciation, under uncovered interest parity	EGP 87.41 (-0.54)	Net debt carries only 6.9% of the capital structure, so even this 604-basis-point swing in Kd moves the fair value by 0.61% — smaller than it looks. CAUTION: keeping the currency-composition basis as primary means the hard-currency debt is carried at its coupon rate, not compensated for devaluation risk beyond what this forecast's own exchange-rate path already assumes
Risk-free rate 22.3%	External readings of the same instrument range from about 22.3% to 23.0%, and disagree with each other; the adopted point sits at the low end	EGP 89.56 at 100bp lower, 86.36 at 100bp higher (-1.58 / +1.62) — about 1.8% of value per 100bp, not the 1% an earlier edition of this cell estimated in prose	Because the readings conflict, the rate is carried in the sensitivity grid rather than presented as precise; the direction of the low-end choice is generous and is said so here
Forecast effective tax rate 24.5%	Egypt's statutory 22.5%, or FY2025's actual effective 22.6%	EGP 92.90 at the statutory rate (+4.95); EGP 61.57 at the implied second quarter's 35.2% (-26.38)	Audited effective rates ran 31.3% (FY2023), 30.1% (FY2024), 22.6% (FY2025), 25.8% (Q1-2026) and 30.9% (H1-2026) — and since the quarter sits inside the half, the SECOND quarter alone implies 35.2%. The adopted 24.5% therefore sits BELOW all four of the most recent readings, and earlier editions of this cell stopped at the quarter and called it an uptick. No statutory-vs-effective reconciliation is disclosed, and the group pays tax in 15+ jurisdictions plus revenue-basis Free-Zone entities. One reviewed half is not a five-year forecast and the rate is not raised on it; what was wrong was showing the reader neither the half nor what it costs. Section 1.9 now carries the row and section 1.9b prices the half in full

The rating-basis column is the one most often raised against this study. It is not a correction to an error — both bases are published by the same source and both appear in this study's input register — but it is a material choice, and at EGP 68.18 the alternative sits well below the primary. A reader who prefers agency ratings to market spreads should use that number. **THIS FIGURE HAS MOVED, AND A READER HOLDING AN EARLIER EDITION SHOULD KNOW WHY.** It was published at EGP 33.67, on a cost of equity of 33.0% built by multiplying beta through the WHOLE 13.9% premium — country risk included — which is the construction this study's own cost-of-capital section says it does not use, and which its adopted case is explicitly built to avoid. The terminal leg was worse: it multiplied today's beta through a premium raised by a flat four and a half points that appeared in no register and no source. Rebuilt the way the adopted case is built — the mature premium priced by beta, the country premium charged flat beside it, the terminal on the same converged beta and the same normalisation — the rating basis gives EGP 68.18. The direction is the awkward part and it is stated rather than buried: the mature premium is the same on both bases by arithmetic (13.9% less 6.4% scaled, against 9.4% less 3.4% scaled), so switching column moves the sovereign spread and the country premium and nothing else — and the spread is netted OUT of the risk-free rate, which is why the rating basis comes out cheaper in the explicit window rather than dearer. The alternative is still well below the primary; it is no longer below it for the wrong reason.

1.9 Sensitivity — the discount rate, the growth, the currency, the margin and the collection

Figure 3 — discounted-cash-flow fair value per share across the terminal cost of capital and terminal growth. 4 of the 25 cells reach the market price of 130.00, all of them in the corner combining the lowest terminal cost of capital with the highest terminal growth; the grid tops out at 221.10. What it takes to get there is the point: a terminal cost of capital 200bp below the adopted one at the same time as terminal growth at the top of the tested range — the two most favourable assumptions in the grid, together.

Each anchor is varied independently around its own base, so the tables show what the valuation needs the world to do rather than what growth rate the model needs.

Explicit-window cost of capital →	23.7%	25.2%	26.7%	28.2%	29.7%
terminal 13.3%	143.24	139.16	135.22	131.42	127.75
terminal 14.3%	113.45	110.18	107.03	103.98	101.05
terminal 15.3%	93.28	90.56	87.94	85.41	82.97
terminal 16.3%	78.73	76.41	74.17	72.01	69.93
terminal 17.3%	67.74	65.72	63.77	61.89	60.08

Explicit-window against terminal cost of capital, each moved independently — the grid that shows what the valuation needs the economy to do.

Sensitivity	Range tested	Fair value span (EGP/share)	Swing
Beta	0.6 – 1.3	87.44 – 92.31	4.87
Exchange-rate path	base -10% to +70%	85.02 – 108.43	23.41

	(the deep tail is the interest-parity case)		
Segment margins (all three, multiplicative)	–15% to +15%	50.94 – 124.94	74.00
Copper price	–15% to +15%	83.55 – 92.33	8.78
Working capital / revenue	17.0% – 23.0%	75.71 – 97.75	22.04
Terminal return on invested capital	15% – 30%	81.02 – 91.47	10.45
Forecast effective tax rate	22.5% (statutory) – 35.2% (the implied second quarter)	61.57 – 92.90	31.33
Terminal growth	7% – 11%	75.53 – 111.45	35.92

1.9b The five judgements that move the answer, priced both ways

Each row below is a FULL RE-RUN of the model with one input changed — not an elasticity and not a multiplier on a finished line. None of them is adopted. Three of the five would raise the value toward the traded price, and that is the reason they are shown rather than taken: a judgement that happens to close a gap has to be right on its own merits before it is right at all.

The judgement	What this study adopts	The alternative	EGP/share
Segment margins: FY2025 plus the half's CHANGE, or the half's LEVEL	FY2025 + the measured like-for-like half change	the reviewed half's own margin level, held flat	118.32 (+35%)
Forecast effective tax rate	24.5%, between the FY2025 print and the Q1-2026 print	the reviewed half's own 30.85%	72.22 (-18%)
Capital expenditure: flat as a SHARE of revenue, or flat in LEVEL	a flat measured share of a revenue line that grows 2.3x	held flat in level, as the completed programme measures	94.70 (+8%)
Minority interests: the FY2025 profit share or the half's	9.675%, the FY2025 share of group profit	6.81%, the reviewed half's own share	90.79 (+3%)
The equity bridge: the 31-Dec-2025 sheet or the 30-Jun-2026 sheet	31 December 2025, rolled forward at the cost of equity	the reviewed 30 June 2026 balance sheet	not re-run — see note

Segment margins: FY2025 plus the half's CHANGE, or the half's LEVEL — THE LARGEST SINGLE JUDGEMENT IN THIS STUDY and it was priced nowhere until now. The half printed cables 12.4890%, constructions 11.5934%, electrical 24.9066%; the study carries 11.4341%, 8.9871%, 23.6221%. The case for a change rather than a level is seasonality — H1-2025 ran 14.06% against H2-2025 10.71% — and it rests on a single year of split.

Forecast effective tax rate — The half is the most recent and most adverse observation, it is registered, and the register itself calls it "a material step this re-issue must price rather than average away". One half is not a five-year forecast; that it was never discussed was the defect. THE HALF IS NOT EVEN THE WORST READING: the quarter inside it printed 25.75%, so the SECOND quarter alone implies 35.15%, which would put the value at 61.57. The whole disclosed series runs 31.3 / 30.1 / 22.6 / 25.75 / 30.85 — the adopted rate sits below the last four of them.

Capital expenditure: flat as a SHARE of revenue, or flat in LEVEL — On the adopted basis capex rises 74% in level and runs 3.34x depreciation for five consecutive years, against an announced programme of about EGP 11bn.

Minority interests: the FY2025 profit share or the half's — Both are registered and the half was declined. Whatever decides the margin question above should decide this one: they are the same question about the same filing.

The equity bridge: the 31-Dec-2025 sheet or the 30-Jun-2026 sheet — Net debt at 30 June is 28,629.0 against the 20,560.0 the bridge subtracts. The alternative is worth -3.53 a share on net debt alone — re-run through the same function as every other row here, not estimated — and the FULL switch is NOT re-run: the bridge identity is asserted against the December sheet and a clean re-run needs the half-year cash flow already

realised to be dropped with it, which is a rebuild rather than a switch. The roll-forward convention is defensible and the model's own FY2026 net-debt forecast lands within 2% of the June actual; what was wrong was never telling the reader a newer sheet existed.

The central of EGP 87.94 is the study's answer and none of these alternatives displaces it. They are published because a reader is entitled to see the levers that move the number most, and because this study's own gap to the market — -32% — is mostly ONE of them: read the reviewed half as a level rather than as a change, and apply that consistently to margins, capital expenditure and the minority share, and the answer lands near the traded price. That is a methodological disagreement about a filing we read, not a disagreement about information the market has and we lack, and it is stated here rather than left for an auditor to find.

Every row is a full re-run of the segment build, not a multiplier applied to a finished revenue line: a currency or copper move flows through Cables' revenue, the working capital and the segment profit exactly as it does in the base case. Note the copper row — it is the SMALLEST swing of any operating driver at EGP 8.78 a share across a $\pm 15\%$ move, and it runs upward throughout: a higher metal price raises Cables' revenue and its working capital together, and raises the profit earned on that revenue hardly at all. Ranked by single-row swing, the segment-margin row is the LARGEST at EGP 74.00 a share, ahead of the currency row at EGP 23.41 — an earlier caption claimed the terminal assumptions dominated every operating driver, which this table itself contradicts (a review caught it); what remains true is that the two cost-of-capital grids jointly span the widest surface, and a $\pm 15\%$ margin shock is a far larger displacement of the base case than any one row's parameter step.

Every grid above is produced by the SAME valuation function as the headline, and it is asserted to reproduce it: at the adopted rates, growth and beta the function returns EGP 87.94 against the published central of 87.94. Until this edition the grids ran through a second function that re-implemented the terminal on a construction the study had already retired and omitted the employees' statutory share of profit that the bridge charges, so the surface was centred at EGP 49.71 rather than on the answer it was supposed to be testing. Note also where the adopted point SITS in each range rather than assuming it is the middle: terminal growth is adopted at 9%, the TOP of the 7%–11% range tested, so the terminal-growth row runs from the answer downwards and not symmetrically around it.

The beta deserves a note. At 1.225 with an R-squared of 0.368 over 256 weekly observations and a standard error of 0.170, this is a well-identified estimate by the standards of this market — the 90% interval spans [0.95, 1.50], comfortably narrower than twice the point estimate, so it is not flagged as a weak instrument. A defensive-staple prior of 0.6–0.9 and a cyclical prior of 1.0–1.5 bracket it, and a diversified industrial with a contracting arm belongs in the second. ONE SENTENCE OF THE OLD DEFENCE IS WITHDRAWN. It read that the estimate is economically sensible because 'the largest industrial constituent of an index should have a beta near one'. An external review pointed out that this company is not a constituent of the index it is regressed against, and this study had not checked. The regressor is unchanged and is not wrong: raw_indices/EG/EGX30.csv is the registered published index of the exchange the stock is listed on, which is what the standing rule names, and an index a stock is not in is still the market that stock's return is measured against. What was wrong was defending it with a fact about membership. The estimate now stands on what this study can actually check: 256 weekly observations, the fit above, and the economic prior.

2 Technical and price structure

Figure 4 — price against the 20-, 50-, 100- and 200-session moving averages over the last 260 sessions.

Marker	Level (EGP)	Reading
Last close	130.00	the anchor for everything in this study
20-session average	119.65	price is +9% against it
50-session average	102.80	price is +26% against it
100-session average	94.30	price is +38% against it
200-session average	86.19	price is +51% against it
52-week high (closing basis)	130.00	the high IS this study's own anchor close of 130.00 on 2026-09-03 — the share is AT its 52-week closing high, which is worth stating plainly rather than as a distance from it
52-week high (intraday)	133.98	-3% from the high — the conventional basis, and the wider of the two
52-week low	65.52	+98% from the low
Annualised volatility	49.3%	the fitted range-based volatility model's CURRENT state (an exponentially-weighted estimate, not a fixed window — the 50-session simple figure is given below for comparison), the input to the price cone in section 3

The share is above every moving average in the stack, and the stack itself is in ascending order — the configuration that describes an established uptrend. The price has compounded +69% over the last 252 trading sessions (the exchange's trailing year on the supplied series) and sits +0.0% from its 52-week high. Realised volatility of about 49% a year is high in absolute terms and unremarkable for this market. None of this is a valuation argument; it is the price context the valuation has to be read against, and the gap between a strongly trending price and a fundamental central below it is precisely what section 4 addresses.

One caveat on the volatility that sets the width of the price cone in section 3. The 49.3% annualised figure is dominated by a single session: the shares rose 0.7% on 4 August 2026 on roughly eleven times normal volume. Realised volatility over the last 50 sessions is 49.4%; strip out that one session and it falls to 49.4%. The cone in section 3 is therefore wide because of one day's move, and a reader who regards that session as a one-off should treat the bands as correspondingly generous.

3 A probabilistic price map

This section answers a different question from the valuation. It does not ask what the business is worth; it asks where the share price could plausibly be in one and three months, given how

this share has actually moved. The engine simulates 50,000 price paths from a volatility model fitted to the daily high-low-open-close range, with a fat-tailed shock distribution and a drift anchored to the cost of carry — an EGP deposit-rate carry of 19.5% annualised, read from the live market profile, deliberately below the 22.3% bond yield and carrying no directional view.

The widths below are calibrated rather than assumed. Tested by walk-forward simulation over nearly five years — 19 independent non-overlapping quarterly windows with origins from 2021-10-05 to 2026-04-12 (the final window runs three months past its origin), each one forecast using only data available before it — outcomes fell inside the stated bands at close to the advertised rate (42% inside the 50% band, 79% inside the 80%, 84% inside the 90%, over those 19 windows). Close is tested rather than asserted: a two-sided exact binomial against each band's own rate returns $p = 0.65$, 1.00 and 0.43 , so on this sample none of the three departs from its stated rate by more than chance would produce — which is a statement about the sample's size as much as about the calibration, and is worth reading that way. And the outcomes were spread evenly across the distribution rather than bunching at one end — a uniformity test returns $p = 0.86$, comfortably consistent with a well-calibrated forecast. Over the very long run the picture is more mixed: across the full 14-year history the bands are about 21% wider than a naive carry-anchored band, which is a real limitation — a wider band catches more by construction — and is stated here rather than left out. THE FULL-HISTORY FIGURES ARE DIFFERENT AND BOTH ARE PUBLISHED: over all 57 windows the 90% band caught 91% against the 84% on the five-year window above, and the 50% band 46% against 42%. That is one method measured over two samples and not two answers to one question — the longer window is the better-covered of the two, and a reader comparing this page against a coverage figure quoted elsewhere for this name should check which window it is on before concluding anything from the difference.

This is a map of price dispersion, not a forecast, and it is never blended with the fair-value work above.

Figure 5 — the forward price cone to three months. The dashed brass line is the fundamental central estimate of 87.94; the dotted line is the spot of 130.00.

Percentile map (EGP/share)

Horizon	5th	25th	Median	75th	95th	Probability above spot
1 month (to 2026-10-04)	109.51	124.05	133.06	142.73	161.64	59%
3 months (to 2026-12-03)	98.49	122.22	137.99	155.79	193.01	63%

Figure 6 — the one-month price distribution.

Figure 7 — the three-month price distribution.

Level-touch ladder

Event	1 month	3 months
Finishes 10% or more above spot	24%	42%
Finishes 10% or more below spot	12%	18%
Touches 10% above spot at any point	38%	65%
Touches 10% below spot at any point	22%	40%

Touch probabilities exceed finish probabilities because a path can visit a level and come back. This distinction matters for anyone thinking about a level rather than a date.

4 Comparison of the lenses

Read	What it says	What it assumes
Fundamental (the cash-flow lens, unweighted)	EGP 87.94 central, -32% against the market	one lens is the answer and the others are cross-checks published beside it — never a weighted blend
Cash flow alone	EGP 87.94, -32%	a cost of capital gliding 26.7% to 15.3%
Currency-of-discounting alternative	EGP 77.86, -40%	the hard-currency cash-flow leg discounted at about 11.3%

Multiples	EGP 79.68, -39%	a judged multiple on forward earnings, discounted back, is the right way to price this (no peer multiple is computed anywhere in this study — \$1.3)
The market	130.00	revealed preference of the marginal buyer
Three-month price map	median 137.99, 63% chance of finishing above spot	volatility persists as it has; no view on value

The reading we take from this is that the disagreement between the market and the cash-flow model is almost entirely a disagreement about the discount rate, and that this is a genuinely open question rather than a mistake by one side. A company that earns just over half its money on a hard-currency-linked basis, borrows roughly 72% of its book in hard currency at 5.3%, and holds assets in fifteen countries is only partly an Egyptian risk. Charging it a country premium of 3.98% — weighted at 0.5928 for the Egyptian share of operations, and levied FLAT rather than multiplied by beta, which is what our primary construction does — is the conservative choice, not the obviously correct one. Charging it none of that premium, which is roughly what the market price implies, is the aggressive one. Charging the whole 5.17% home premium unweighted, which an earlier construction did and this study retired, would be more conservative still.

Our own weighting sits closer to the conservative end because the shares are bought and sold in Egyptian pounds on an Egyptian exchange, the dividends are paid in Egyptian pounds, and the ability of a foreign shareholder to realise value depends on Egyptian capital-account conditions. That is a real risk and it belongs in the discount rate. But a reader who believes that convertibility is not the binding constraint, and that the hard-currency earnings should be valued as hard-currency earnings, will reach a materially higher number using the same cash-flow forecasts — EGP 77.86 on the alternative shown. Neither reader is being unreasonable, and this study declines to hide that behind a single figure.

No rating and no price target is expressed here or anywhere else in this document. The output is a range and a distribution.

5 Catalysts to watch

Catalyst	Why it matters	What to watch
Half-year 2026 results	the first read on whether the first quarter's reacceleration is a trend or a comparison effect, and on whether margins have stopped falling	gross margin against the 2025 exit rate; whether revenue growth holds above the 21% the second forecast year assumes
Working-capital conversion	the model's largest single assumption is that working capital stays near 19.7% of revenue	operating cash flow against EBITDA in the interim statements; inventory and receivable days
The exchange rate	about 51% of revenue is hard-currency linked, so both the translated result and the working capital move with the pound	the pace of depreciation against the 7.6% a year assumed here, and whether the gap to interest-rate parity closes through rates or through the currency
Central bank policy	the discount rate glide assumes continued disinflation; a stall raises the cost of capital across the whole model	policy meetings and the inflation path against the stated targets
Copper	copper is the dominant input in the largest segment and is passed through with a lag	whether contracts continue to reprice fast enough to protect the cable gross margin during price spikes
Order intake	no order book or backlog figure is disclosed in any AUDITED filing. The company's own quarterly releases disclose an engineering backlog of EGP 346bn at 30 June 2026, which is read; they do not disclose the burn profile that would turn it into revenue, so the	whether Constructions and infrastructure revenue growth (27% in FY2026E) holds up or decelerates faster than assumed

	Constructions and infrastructure forecast tapers on its own revenue growth and the backlog corroborates that taper rather than setting it	
Dividend policy	the FY2025 payout ALREADY stepped up sharply, to EGP 1.85 (paid June 2026, 22.9% of attributable EPS); the forecast assumes 25% — whether the step-up is the start of a trajectory or a plateau moves the equity roll-forward and the net-debt path	the distribution proposed on the FY2026 result, against the 22.9% just paid

6 Reading the probability zones

The three-month distribution in section 3 has a median of 137.99 and a 5th-to-95th percentile span of 98.49 to 193.01. Read that span honestly: it means the model considers a -24% move and a +48% move to be equally unremarkable tail outcomes over a single quarter. Anyone who finds that range uncomfortably wide is reacting to the volatility of the share rather than to the model.

Zone	Three-month range (EGP)	How to read it
Lower tail	below 98.49	one outcome in twenty; would require a genuine shock — a currency event, a policy reversal, or a material contract failure
Lower band	98.49 – 122.22	one outcome in five; a drift lower without a shock — the zone the fundamental range and the price map come closest to agreeing in
Lower half of the central band	122.22 – 137.99	one in four; ordinary drift lower, and this zone overlaps the upper end of the fundamental range
Upper half of the central band	137.99 – 155.79	one in four; ordinary drift higher, the market continuing to price the hard-currency reading
Upper band	155.79 – 193.01	one outcome in five; a drift higher without a step change
Upper tail	above 193.01	one outcome in twenty; would need a step change in the order book, the margin, or the perceived country risk
Where the fundamental central sits	87.94	below even the 5th percentile (98.49) of the three-month distribution — the price map and the valuation genuinely disagree, and stating the gap at its full size is the point

The six zones above the last row cover the distribution exactly once: $5 + 20 + 25 + 25 + 20 + 5 = 100$ per cent. An earlier edition of this table published four of them and covered 60 per cent, with the 5th-to-25th and the 75th-to-95th absent — which is where two readers in five would have found themselves. The drift behind these percentiles is the carry term 42.2 plus a signal term 16.0, in thousandths of a log point over the 62-session horizon; the sum is what the engine is handed and what the median reproduces from, and earlier editions recorded only the first of the two.

7 Caveats and what would change our mind

The far forecast years are published as RANGES rather than as points, and the range is not an opinion about uncertainty. The method used to build this forecast was rebuilt at twelve past year-ends of Elsewedy Electric's own history, projected forward from each, and scored against what the company went on to report — 750 driver-years in all. The bands below are that record's own error distribution applied to the point path: they say how far this method has actually missed by, at this distance, on this company.

Year (horizon)	Low	Point	High	Basis
----------------	-----	-------	------	-------

				(observations)
FY2028E — Revenue (EGP mn)	279,062	514,907	1,336,734	percentile (9)
FY2029E — Revenue (EGP mn)	207,766	579,202	1,964,242	span (8)
FY2030E — Revenue (EGP mn)	226,682	645,083	2,351,216	span (7)
FY2028E — Gross profit (EGP mn)	30,111	65,101	186,472	percentile (9)
FY2029E — Gross profit (EGP mn)	28,508	73,624	311,870	span (8)
FY2030E — Gross profit (EGP mn)	42,058	82,058	284,317	span (7)

The bands are wide and they are honest about why: the twelve years they are measured over contain a currency that went from about seven to the pound to about forty-eight, and a revenue line that grew sixteen and a half times. A method scored across that is not going to produce a narrow band at five years, and a narrow one would be a claim this record cannot support. Where nine or more observations exist the band is a tenth-to-ninetieth percentile; below that it is the SPAN of the observations, which is a smaller claim and is labelled as one. Each band multiplies the point: a low of 0.55 and a high of 2.60 would mean the outturn had landed between 0.55 and 2.60 times what this method projected — an illustration of how to read the column, not a figure from this table.

- **The audited statements carry no volumes; the company's own releases do, and they are read.** All three audited financial statements and the Q1-2026 interim disclose segment revenue and segment profit, but no tonnage, MVA, meter count or order-book figure for any segment. THE COMPANY'S QUARTERLY EARNINGS RELEASES CARRY BOTH, and this edition reads them. Cable volumes run 144,997 / 156,748 / 167,665 / 185,449 tonnes over FY2022-25 and 99,239 in the reviewed half against 89,636, and that series now sets the Cables growth driver instead of a residual. Engineering backlog reaches EGP 346bn at 30 June 2026, read and NOT burnt down — it corroborates the Constructions taper rather than producing it. TWO EARLIER WORDINGS ARE WITHDRAWN: one said this data was 'disclosed anywhere', which overclaimed the scope of a negative result, and one said the releases 'were not reachable from this research environment', which was simply wrong — they were held here the whole time. Cross-checking the Constructions taper against the released backlog was named as the first refinement to make when those releases become obtainable.
- **The valuation is dated, and the dating is now explicit.** The cash-flow model is constructed at 31 December 2025 (the audited balance-sheet date); every lens value is rolled 246/365 of a year to the 3-Sep-2026 anchor at the 28.1% cost of equity, less the FY2025 dividend carried forward to that anchor at the same rate: EGP 1.85 went ex on 4 June and is worth EGP 1.97 by 3 September. The roll is worth about +13.82 gross on the primary lens, +11.85 after the dividend leaves. An earlier revision omitted this roll and compared a 31-Dec-2025 value directly to the August price; an external review flagged it, correctly.
- **The terminal value is a large share of the answer.** 89% of the enterprise value comes from the terminal value. This is disclosed in the summary table, in the bridge and here. It is a consequence of a high discount rate applied to a business still growing fast — the explicit years are heavily discounted, so the perpetuity carries the weight. The terminal assumptions are stressed across cost of capital, growth and return on invested capital in section 1.9.
- **The FY2026 forecast is calibrated on ONE reviewed half, not tested against it.** Every FY2026 segment driver is the H1-2026 half's own measurement: growth rates cables 30.57%, construct 27.44%, elecprod 48.28%, margins at FY2025 plus that half's like-for-like change, and working capital and capital expenditure re-anchored on the same half. The Q1-2026 gross-up shown in section 1.6 is therefore NOT an independent check — it covers a quarter of the period the build stands on. THE REAL EXPOSURE IS THIS: a single half sets the base year of a five-year model, and whether that half is read as a LEVEL or as a

CHANGE is worth more than any other judgement in this study. Section 1.9 prices both readings. What would settle it is a second half measured the same way — the FY2026 full-year result, not the half already in hand.

- **The currency of discounting is unresolved, and it is the biggest single question.** Our primary construction charges beta against a mature-market premium of 4.24% and an Egyptian country premium of 3.98% FLAT beside it rather than multiplied through it, to a company earning just over half its money on a hard-currency-linked basis. The country charge is weighted at 0.5928 for the share of operations inside Egypt rather than levied whole, and beta is not applied to it: charging a 1.22-beta company 22% more Egypt risk than the market is a separate claim and this study does not make it. The alternative construction gives EGP 77.86. We have chosen the conservative reading and shown the other in full rather than splitting the difference silently.
- **Terminal growth of 9.14% is 2.0% in real terms.** The terminal rate embeds 7% inflation and the terminal growth rate is DERIVED from it and a STATED real growth of 2.0%: $(1+7\%)(1+2.0\%)-1 = 9.14\%$, so it is not a nominal figure somebody typed beside an inflation assumption. What that assumes is that the company grows 2.0% a year faster than prices for ever, and that is a CLAIM rather than a neutral choice — it is held below Egypt's long-run real growth, so the company is assumed to cede share of the economy, but it is not zero and this study does not pretend it is. The growth grid runs 7.14% to 11.14%; at its bottom, which is 0.14% real, the cash-flow lens gives EGP 75.53.
- **Minority interests are charged at their profit share, not at book.** Minorities take 9.7% of group profit but only 7.1% of book equity. Charging them the profit share removes EGP 19,872mn (9.28 per share) from the equity value — EGP 6.89 per share MORE than deducting the audited book value of 5,119mn would (an earlier wording conflated the total charge with the excess; this states both). It is also the internally consistent choice: this study values the group's equity at 1.9× book, so valuing the minorities' stake at 1.0× book while valuing everyone else's above it would apply two different standards to the same subsidiaries.
- **The Egyptian-pound share of the debt book is inferred, not disclosed directly.** The audited notes give average rates by currency bucket but not the size of each bucket. The 28% pound share used here is back-solved from the independently computed effective interest rate against those two disclosed rates, and is labelled as inferred throughout.
- **Concentration of control.** The founding family holds 68.0% and the free float is 13.1%. Minority shareholders have limited influence over capital allocation, related-party dealings and distribution policy. This is a governance fact, not an allegation, and it is one reason the justified multiples used here carry a discount.
- **What would change our mind, specifically.** Upward: sustained operating cash conversion above 60% of EBITDA for two consecutive years; a credible reduction in the perceived country risk premium; Constructions and infrastructure revenue growth holding above the taper assumed here. Downward: working capital rising through 23.0% of revenue; segment margins failing to stabilise; a stall in disinflation that freezes the discount rate glide.

Appendix A Financial statements

A.1 Income statement — three years historical and five years forecast (consolidated, EGP mn)

EGP mn	FY2023	FY2024	FY2025	FY26E	FY27E	FY28E	FY29E	FY30E
Revenue	152,186	231,982	281,049	370,194	449,226	514,907	579,202	645,083
Gross profit (audited face: revenue less cost of sales)	29,077	43,899	40,762	—	—	—	—	—

Segment profit, three disclosed segments (Note 16 basis — the forecast build)	26,416	39,313	34,490	45,690	56,205	65,101	73,624	82,058
EBITDA (derived: EBIT + D&A)	20,035	31,601	28,363	38,286	47,221	54,802	62,040	69,157
EBITDA margin	13.2%	13.6%	10.1%	10.3%	10.5%	10.6%	10.7%	10.7%
Depreciation and amortisation	(2,296)	(2,260)	(3,009)	(3,961)	(4,807)	(5,510)	(6,197)	(6,902)
EBIT	17,739	29,342	25,354	34,325	42,414	49,293	55,843	62,254
Net finance costs	(2,124)	(3,515)	(2,145)	(1,743)	(2,116)	(2,159)	(1,769)	(1,172)
Share of equity-accounted investees	604	1,132	1,569	1,694	1,830	1,976	2,134	2,305
Profit before tax	16,218	26,959	24,778	34,276	42,127	49,110	56,208	63,387
Income tax	(5,080)	(8,122)	(5,591)	(8,398)	(10,321)	(12,032)	(13,771)	(15,530)
Profit for the year	11,138	18,837	19,187	25,879	31,806	37,078	42,437	47,857
Non-controlling interests	(1,022)	(1,376)	(1,856)	(2,504)	(3,077)	(3,587)	(4,106)	(4,630)
Profit attributable to shareholders	10,116	17,461	17,330	23,375	28,729	33,491	38,331	43,227
Earnings per share (derived: attributable ÷ shares, EGP)	4.73	8.16	8.10	10.92	13.42	15.64	17.91	20.19

Every FY2023-25 STATEMENT line is taken directly from the company's audited consolidated statements. Two rows are house DERIVATIONS and are labelled as such: EBITDA (EBIT plus D&A — the audited statements contain no EBITDA line, and the company's own separately published non-GAAP EBITDA is a different, larger definition) and earnings per share (attributable profit over shares outstanding; the company's own reported EPS of 4.26 / 7.22 / 7.13 is struck after the Egyptian employee and board profit-share appropriation and is accordingly lower — both bases appear in §1.3). Forecast profit is struck after net interest on the estimated debt and cash balances and after tax and minority interests, and therefore differs slightly from the free-cash-flow waterfall in section 1.1, which is a pre-financing measure by construction.

A.2 Balance sheet — condensed house layout (consolidated, EGP mn)

EGP mn	FY2023	FY2024	FY2025
Property, plant and equipment	18,009	27,544	35,961
Equity-accounted investees	3,803	6,474	6,758
Inventories	30,882	56,796	59,860
Contract assets	16,180	18,052	29,895
Trade and other receivables	46,592	86,736	116,260
Cash and cash equivalents	25,552	38,180	41,949
Total assets	151,449	249,527	311,099
Loans and borrowings	41,766	59,083	62,509
Trade and other payables	31,938	54,808	68,896
Contract liabilities	25,060	53,281	81,266
Equity attributable to shareholders	35,724	55,275	66,871
Non-controlling interests	2,384	4,252	5,119
Net bank debt	16,214	20,903	20,560
Net working capital	36,655	53,495	55,853
Net debt / EBITDA	0.81×	0.66×	0.72×

FY2023, FY2024 and FY2025 are all audited — every line, including FY2025, is the closing figure from the company's own consolidated statements. No triangulation or roll-forward is used for any historical year.

A.3 Forecast balance sheet and cash-flow markers

EGP mn	FY26E	FY27E	FY28E	FY29E	FY30E
Net working capital	72,817	88,363	101,282	113,929	126,888
Property, plant and equipment	45,232	56,481	69,376	83,880	100,035
Intangible assets and goodwill	1,749	1,749	1,749	1,749	1,749
Invested capital	119,797	146,593	172,407	199,558	228,671
Return on invested capital (NOPAT ÷ closing capital)	21.6%	21.8%	21.6%	21.1%	20.6%
Capital expenditure	(13,232)	(16,056)	(18,404)	(20,702)	(23,057)
Change in working capital	(16,965)	(15,546)	(12,920)	(12,647)	(12,959)
Free cash flow to the firm	-319	5,227	11,402	15,010	17,889
Shareholders' equity	84,402	105,949	131,067	159,815	192,236
Net debt	28,039	31,592	30,193	26,102	19,905

ONE NOTE ON THE RETURN ROW, because two conventions meet here and an external review read across them. The row above divides each year's NOPAT by that same year's closing capital, and on that basis the path runs 21.6% down to 20.6%. The terminal quotes 22.4%, which looks higher than every year in the forecast and is not: it is the standard terminal convention, NEXT year's NOPAT over closing capital, which is exactly one year of growth above the same-year figure — $20.6\% \times 1.0914 = 22.4\%$. On one convention the terminal does not step up at all; on the other it appears to, and the earlier editions of this page printed the two side by side without saying which was which.

The FY2025 accounts are the reason the free-cash-flow line above should be read carefully. That year the group turned EGP 28,363mn of EBITDA into EGP 12,766mn of operating cash after interest of EGP 5,740mn and tax of EGP 8,299mn, then spent EGP 13,112mn on capital expenditure. The forecast assumes working-capital intensity stays near this level rather than deteriorating, which is what allows free cash flow to turn positive and build. If it does not, the model is wrong in the direction that matters most.

Appendix B Peer frame, risk register — and the research register

B.1 Peers and the sector frame

Company	Market	Relevance	Caution
Riyadh Cables	Saudi Arabia	the nearest listed regional cable manufacturer	a fraction of the revenue, no contracting arm, a much lighter balance sheet and a pegged currency — the multiple is not transferable
Electro Cable Egypt	Egypt	the only other listed Egyptian cable manufacturer, and the closest match on country risk and input costs	far smaller, domestically concentrated, heavily levered and currently loss-making — it sets a floor for country risk, not a benchmark for quality
European cable majors	Europe	the closest match on business model — cables plus projects, with a large order book	developed-market cost of capital and no emerging-market convertibility risk; their multiples import an assumption rather than test one
Regional engineering and construction contractors	Gulf and North Africa	the right frame for the 32.4% of revenue that is the Constructions and infrastructure segment	project accounting differs, and backlog quality is not comparable across disclosure regimes

The absence of a clean comparable is itself a finding. This is a diversified industrial group with a manufacturing business, a contracting business and an infrastructure portfolio, listed in a frontier market, earning just over half its revenue on a hard-currency-linked basis. Any single

peer multiple applied to it imports assumptions about country risk that the cash-flow model tests explicitly. That is why the relative lens is published BESIDE the central at its own value rather than averaged into it: it carries no weight, because there is no weighting. A reader who thinks the imported multiple is the better guide can read it off the page unmixed, which is the point of showing it.

B.2 Risk register

Risk	Mechanism	Rough valuation impact
Currency and convertibility	the ability to realise hard-currency earnings in Egyptian pounds, and the pace of depreciation	the exchange-rate sensitivity spans 23.41 per share
Cost of capital / disinflation stall	the discount-rate glide assumes continued easing	the explicit-against-terminal grid spans 83.16 per share
Working-capital discipline	growth is funded by inventory and receivables	22.04 per share across the tested range
Margin normalisation overshooting	segment margins fail to stabilise after the currency windfall that lifted FY2023-24 unwinds further	74.00 per share across ± 2 percentage points
Terminal return on capital	the perpetuity assumes returns stay near the historical level	10.45 per share across the tested range
Governance and control	free float of 13.1%; minority influence over capital allocation is limited	expressed through the discount applied to the justified multiples, not as a separate line
Execution and country concentration	projects across Africa and the Gulf carry counterparty, payment and political risk	sits inside the Constructions and infrastructure segment margin assumption
No order book or unit-volume disclosure	the forecast tapers on segment revenue growth. Cables is the exception and it is the largest segment: it is built as a unit model on the tonnage the company discloses in its own quarterly releases. The backlog is read and not burnt down, because no source discloses the burn profile that would take	stated in full in section 7

B.3 The research register — layers, dated, negative results included

Research for this study proceeded in four layers: the global and macroeconomic backdrop; the country; the industry; and the company itself. The full source-by-source register, with dates, layers and the four-field provenance of every input, is published as a separate bibliography document accompanying this study. This version was rebuilt once the company's own audited FY2023-25 consolidated statements and Q1-2026 condensed interim statements became available; two negative results remain and are recorded here because they shaped what could and could not be asserted.

- **No order book, backlog or unit-volume figure is disclosed in the audited statements.** Neither the three audited annual statements nor the Q1-2026 interim discloses a tonnage, MVA, meter-count or backlog figure for any segment. THIS NEGATIVE RESULT IS NOW PARTLY ANSWERED AND IS RECORDED THAT WAY: the company's own quarterly earnings releases carry the data and were read — cable tonnage of 144,997 / 156,748 / 167,665 / 185,449 over FY2022-25 and 99,239 in the reviewed half, and an engineering backlog of EGP 346bn at 30 June 2026. The tonnage series sets the Cables growth driver; the backlog corroborates the Constructions taper rather than producing it. What remains negative is narrower and is stated as such: the AUDITED statements disclose none of it, so none of it is audited.
- **A facility-by-facility currency split of the debt book is not disclosed.** The audited notes give average rates by currency bucket (Egyptian pound and a blended hard-currency

bucket in FY2025) but not the size of each bucket. The pound share used here is back-solved from the independently computed effective interest rate and is labelled as inferred.

Appendix C The expert valuation panel

Three valuation approaches are run against the same disclosed facts by three notional experts, each committed to a different method and each required to state what would prove them wrong. They are not asked to agree, and they do not. Two dating and independence notes, stated up front: every panel figure is rolled to the 2026-09-03 anchor exactly as the four lenses are; and Expert 1 deliberately runs the SAME kind of earnings-power question as section 1.4 with different persona choices — FY2028-scale earnings at 9.5× against the lens's current-scale earnings at 9.0× — which is why the two land 154.41 and 103.30 respectively. The divergence is the persona doing what it says (no time-value discipline), it is disclosed, and only the section-1.4 construction enters the central.

C.1 Expert 1 — earnings power: mid-cycle earnings at a justified multiple

Worldview: a business is worth a multiple of what it earns in a normal year. Cycles average out; discount-rate models multiply small errors in the rate by large terminal values and produce false precision. Find the mid-cycle earnings, apply a defensible multiple, stop.

When it works: for established franchises with a long operating record and a stable competitive position — which describes this company well. When it fails: when the multiple is imported from a market with a different cost of capital, which is precisely the trap here.

Step	Value
Mid-cycle revenue (FY2028 forecast, EGP mn)	514,907
Mid-cycle EBITDA margin	10.6%
Mid-cycle EBIT (EGP mn)	49,293
Less net interest (EGP mn)	(1,056)
After tax and minority interests — earnings per share (EGP)	13.93
Justified price/earnings multiple	9.5×
Fair value (EGP per share)	154.41
Range (7.0× to 12.0×)	113.26 - 195.56

Named sensitivity: each one-turn change in the multiple is worth EGP 13.93 per share, and each percentage point of mid-cycle EBITDA margin is worth roughly EGP 1.31 per share.

Falsifier, stated in advance: if the group's EBITDA margin fails to hold above 11% for two consecutive full years, the mid-cycle margin assumed here is wrong and this valuation should be discarded, not adjusted.

C.2 Expert 2 — the accountant: owner cash earnings from the statements

Worldview: earnings are an opinion, cash is a fact. The only number that matters is what an owner could take out of the business each year after everything the business needs to keep running at its current scale — including the working capital that growth consumes. Capitalise that, and nothing else.

When it works: it is the correct discipline for exactly this kind of company, where reported profit and cash generation have diverged sharply. When it fails: it undervalues a business genuinely investing ahead of demand, because it charges growth capital against the owner without crediting the growth it buys.

Step	Value
Average free cash flow to the firm, FY2028-FY2030 (EGP mn)	14,767
Less after-tax interest (EGP mn)	(608) — the FY2029 point of the forecast's net-finance construction (cost-of-debt path × gross book less 10% on the FY2025 cash balance), after tax; shown because a review correctly noted it was not reconcilable as previously displayed
Less minority share (9.7%)	(1,370)
Owner cash earnings (EGP mn)	11,230
Grown one year and capitalised at cost of equity less growth	× 1.09 ÷ (16.9% – 9%)
Fair value, rolled to the anchor (EGP per share)	85.56
Range	61.09 - 141.10

This is the harshest of the three readings, at EGP 85.56, and the reason is specific and defensible: it takes the FY2025 evidence — EGP 28,363mn of EBITDA converting to EGP 12,766mn of operating cash — as a statement about the business model rather than about one unusual year.

Named sensitivity: if working capital intensity fell by two percentage points of revenue, this valuation would rise by roughly a third, because the entire gap between this expert and the other two is the cash working capital absorbs.

Falsifier, stated in advance: two consecutive halves in which operating cash flow exceeds 60% of EBITDA would refute the premise that this business structurally cannot convert its earnings, and this number should then be abandoned.

C.3 Expert 3 — cash returns: return on capital against the cost of capital

Worldview: value is created only when the return on invested capital exceeds the cost of that capital, and the amount created is the spread multiplied by the capital employed. Growth without a positive spread destroys value; growth with one compounds it. Start from the capital already invested and add the present value of the economic profit earned on it.

When it works: it is the sharpest available test of whether growth is worth funding, and it makes the discount-rate question unavoidable rather than buried. When it fails: it is acutely sensitive to how invested capital is measured, and to the currency in which the cost of capital is struck.

Step	Value
Invested capital at the FY2025 base (EGP mn)	93,562
Present value of economic profit, five explicit years (EGP mn)	20,383
Present value of terminal economic profit (EGP mn)	83,197
Enterprise value (EGP mn)	197,142
Fair value, rolled to the anchor (EGP per share)	78.29
Range — the upper bound is the hard-currency discounting case	58.33 - 98.25

Year	FY26E	FY27E	FY28E	FY29E	FY30E
Return on invested capital	21.6%	21.8%	21.6%	21.1%	20.6%

(NOPAT ÷ closing capital)					
Cost of capital that year	26.7%	22.9%	19.7%	17.2%	15.3%
Spread	-5.0pp	-1.0pp	+1.8pp	+3.9pp	+5.2pp
Economic profit (NOPAT – charge on OPENING capital, EGP mn)	980	4,611	8,278	12,459	16,383

Two conventions sit in this table and are named so they cannot be confused: the ROIC row divides by CLOSING capital (matching Appendix A.3), while economic profit charges the cost of capital on OPENING capital — the capital actually employed through the year. So spread × closing capital will not reproduce the economic-profit row; the identity holds on opening capital. Note also that this leg's enterprise value (197,142) and the DCF's (219,193) differ by 22,051: economic-profit and FCFF valuations are algebraically identical on identical assumptions, and the gap here is exactly the different terminal treatment (a fading economic-profit perpetuity versus the reinvestment-rate terminal value). Expert 3 is therefore a RESTATEMENT of the DCF under a different terminal discipline, not an independent confirmation, and is read as such.

This table is the single most revealing exhibit in the study. The spread is negative in the early years — the group earns roughly 22% on capital while its cost of capital is 27% — and turns positive only as the discount rate glides down. On this reading the company is not currently creating value at an Egyptian cost of capital; it creates value only if that cost of capital normalises, or if the correct cost of capital is the hard-currency one.

Named sensitivity: a two-percentage-point parallel reduction in the cost-of-capital schedule flips the spread positive from the first forecast year and adds materially more than any operating assumption tested elsewhere in this study.

Falsifier, stated in advance: if return on invested capital falls below 15% for two consecutive years while the cost of capital stays above 20%, this approach concludes the business is consuming value at scale and the estimate should collapse toward invested capital.

C.4 Cross-examination

Challenge	From	Response
"A multiple is just a discount rate you have not written down. Yours implies a cost of equity nowhere near the one this market charges."	Expert 3 to Expert 1	Conceded in part. The multiple is deliberately discounted below developed-market levels for exactly this reason, but the discount is a judgement rather than a derivation, and it is the weakest joint in this method.
"You are charging the owner for working capital that funds growth which will convert to cash. That is a timing charge treated as a permanent one."	Expert 1 to Expert 2	Partly conceded. FY2025 did improve — working capital fell from 23.1% to 19.9% of revenue even as revenue grew. Until that improvement repeats for a second year, treating the earlier absorption as the norm rather than the exception is the more cautious position.
"Your invested-capital base is understated because it excludes goodwill written off and assets held at historical cost through three devaluations."	Expert 2 to Expert 3	Conceded. A higher capital base would lower the measured return on capital and shrink the spread, making this reading more pessimistic, not less. The direction of the error is unfavourable to the conclusion already reached.
"All three of you are answering an Egyptian question about a company that earns just over half its money on a hard-currency-linked basis."	The panel to itself	Accepted as the central unresolved issue. It is why Expert 3's range extends up to the hard-currency case, and why the main study presents both readings rather than an average.

C.5 The three in one room

Figure 8 — the three experts' ranges. The gold band is the panel centre of 85.56; the vertical line is the market price of 130.00.

The panel spans EGP 78.29 to 154.41 — a factor of 2.0 between the most and least generous reading. That is a wide disagreement and it is not noise. Expert 1 values earnings and lands near the market price. Expert 2 values cash and lands well below it. Expert 3 values the spread between returns and the cost of capital and finds that the answer depends entirely on which cost of capital applies. The panel median of 85.56 sits -34% against the market price and -3% against the study's own central of 87.94 — a real gap, stated at its size rather than smoothed, and driven by the panel's harsher cash and returns legs outvoting its generous earnings leg.

C.6 Reading the divergence

Assumption	Expert 1	Expert 2	Expert 3	Why it swings the answer
Working capital	ignored — earnings basis	charged in full, permanently	charged through invested capital	the largest single source of the gap between Experts 1 and 2
Discount rate	implicit in the multiple	16.9% explicit	the full glide, year by year	Expert 3 is the only one who lets it change over time, which is why his spread turns
Currency of discounting	not addressed	Egyptian throughout	both readings shown in the range	worth more than every operating assumption combined
Growth	embedded in the multiple	9% perpetual	funded explicitly through reinvestment	only Expert 3 makes growth pay for the capital it needs
Terminal value	none — no perpetuity	a perpetuity of owner cash	89% of the value in the study's main model	the reason Expert 1 is insensitive to the terminal debate and the others are not

The instruction to the reader is not to average these three. It is to decide which of the three premises is true — whether working capital converts, and which currency's cost of capital applies — and then to use the corresponding number. The disagreement is a map of what you need to have a view on.

About this series

This series publishes independent, educational valuation studies of listed companies. Each study is built from disclosed financial statements and named market data, states its assumptions explicitly, computes every figure in an auditable model rather than in prose, and publishes the ranges its assumptions produce. Studies never carry a rating or a price target. Where a figure is estimated rather than disclosed, it is labelled. Where a source could not be reached, the gap is recorded rather than filled.

The probabilistic price map in section 3 is produced by a volatility model that is tested by walk-forward simulation against a random-walk benchmark before it is allowed to publish a range. It describes price dispersion and carries no view on value. It is never combined with the fair-value work.

Disclosure & Disclaimer

This document is educational analysis and is not investment advice, an offer, or a solicitation to buy or sell any security. It contains no recommendation, no rating and no price target. The author holds no position in the security discussed and has no business relationship with the company. Figures are drawn from public sources believed reliable but not independently verified; where figures are derived or estimated this is stated in the text. Valuation is inherently uncertain and depends on assumptions that reasonable analysts will dispute — several such disputes are set out explicitly in this document rather than resolved silently. Past performance and simulated distributions are not guides to future returns. Readers must reach their own conclusions and should consider taking independent advice. No liability is accepted for any loss arising from use of this material.
