

ADIB-Egypt (EGX: ADIB) — valuation model, 2026-09-10

WHICH COMPANY. Abu Dhabi Islamic Bank – Egypt S.A.E., listed in Cairo, reporting in Egyptian pounds. ADIB is a subsidiary of Abu Dhabi Islamic Bank – U.A.E., the parent, which is a different company covered separately.

HOW TO USE THIS FILE. Every BLUE cell on the Assumptions sheet is an input you may change. Every RED cell is a calculation. Changing the asset yield, or the asset yield, or the growth path, and the value per share on Summary recomputes.

THERE IS NO ENTERPRISE VALUE AND NO WACC IN THIS MODEL, and that is deliberate. A bank's cost of capital is not the WACC. Subtracting them as though they were debt produces a number with no meaning. Everything here is equity value.

MARGINS ARE OUTPUTS. The asset yield and the cost of funds are inputs; the net interest margin, the net interest margin, and the net interest margin are computed from them. None of those four is typed anywhere in this file.

ONE LENS IS THE ANSWER. The dividend discount is the central. Residual income, the relative multiplier, and the relative multiplier are not averaged, and there are no weights in this workbook.

NOT INVESTMENT ADVICE. No rating, no price target. An educational valuation exercise.

ADIB-Egypt — summary

Share price (3 Sep 2026)	52.05

Terminal growth 7.00% = terminal inflation, ZERO REAL. For a bank in an economy whose private credit is 26% of G

15 million — and the bank was ALREADY at EGP 190,427 million on 30 June, so this asks for only +14.4% of treasury bills into customer financing as policy rates fall and bill yields compress, and the path continues

; the six months to June 2026 annualise to 15.30%. The path falls with the CBE's published policy glide (banks plus subordinated financing, and nothing else. FY2025 actual 11.22%. Total liabilities is NOT the same as deposits and that ratio has moved within two points across the whole panel.

The path opens at the reviewed half's level and recovers slowly as trade finance and card income grow with actual 0.238%; the June 2026 half annualises to 0.372%, flattered by trading gains on a moving currency. Net income line. FY2025 actual -0.387%; the June 2026 half annualises to -0.797%, more than double. The path for the first half already spent EGP 2,239 million, so this asks for EGP 2,359 million in the second. Thereafter inflation (FY2023), 2.73% (FY2024), 1.25% (FY2025) and effectively ZERO in the June 2026 half — EGP 2.176 million (FY2023)

the rate is 22.5%; an Egyptian bank pays materially more because the 20% withholding on treasury-bill in Egypt is at a higher level; it is immaterial and is carried rather than dropped so the bridge to attributable profit closes.

Plus 3 billion cash increase, against 9.98% at the FY2025 year end. THIS IS THE BINDING CONSTRAINT on the balance sheet to EGP 15 billion — 300 million new shares at the LE 10 par. IT WAS ISSUED AT PAR, far below book value

has been and already used by the PHDC, EGCH and PHAR cost-of-capital records. IT IS 34 DAYS OLD AGAINST the market for Egypt row, "Sovereign CDS net of Swiss CDS". Netted out of the local-currency risk-free rate so that so the cost of capital is LISTED ON — resolved by `beta_regression.own_stock_beta()` rather than hand-rolled. Beta 1.0747, R-squared 0.9999, TOTAL premium column, not its country premium column — the total is what multiplies beta. The country premium is 5.50% plus the 5.50% emerging-market terminal real convention. It cannot disagree with the inflation the real rate would flat into perpetuity.

Plus that is deliberately conservative: it assumes ADIB-Egypt stops taking share and stops participating in the bank's capital

6 in the second half against +29.3% in the first. The path then decays toward nominal GDP. IT IS NOT A
ues that observed rotation at a decelerating pace. Every point is above both observations, which is the

19.00 -> 12.00) at an asset beta of about 0.75, which is what an Egyptian bank holding treasury bills and

is points in section 1.9.

SUM-OF-THE-PARTS BRIDGE — NOT APPLICABLE, AND THE REASON IS NOT A

ADIB-Egypt is one bank. It consolidates a small leasing and micro-finance operation whose contribution model: non-controlling interests take 0.10% of net profit (EGP 12.4 million of EGP 12601.0 million of 161.3 million. There are no separable parts to value apart, and inventing a sum-of-the-parts here.

FOR A BANK THE EQUIVALENT BRIDGE IS THE CAPITAL ACCOUNT, and it is on the Balance Sheet to be raised, the equity the balance sheet consumed, and the dividend that is what is left. That is the bridge the shareholder receives, and it is the one that matters here.

THIS SHEET IS PRESENT BECAUSE THE STANDARD SHEET LIST REQUIRES IT. A sheet deleted because it was like a sheet nobody built.

What the filings disclose	FY2025
Income from Murabaha, Musharaka, Mudaraba and similar	49,263
Cost of deposits and similar costs	-29,110
Net fees and commissions	2,730
Financing to customers, net	147,226
Customers' deposits	277,564
Total assets	346,711

WHAT IS NOT DISCLOSED, AND SO IS NOT MODELLED

- No split of financing between retail, corporate and small business.
- No split of deposits between current, savings and investment accounts, so the low-cost funding share is
- No geographic or product segment note.
- No disclosed non-performing ratio or coverage in the statements parsed.

A driver this study cannot see is a driver this study does not model. The alternative is inventing a segment

Note

The price-to-book band Egyptian large-cap banks trade in. It is a BAND and not a point becaus

the normalised profit capitalised at the current cost of equity less terminal growth. A check on

se this study could not source a same-day book value for any Egyptian bank other than ADIB itself: the o

whether the cycle is being capitalised, not a valuation.

only peer whose price it holds on the same day is CIB, and CIB's own book value is not in this repository. '

The band is carried as a cross-check on the two cash-flow lenses, weighted at 15%, and it is NOT allowed

l to set the answer. Where a multiple cannot be sourced it is said so rather than filled in.

THERE IS NO FREE-CASH-FLOW-TO-THE-FIRM DISCOUNTED

A bank's deposits are its raw material, not its financing. An enterprise-value discounted cash flow subtracts them as though they were borrowings, which for ADIB-Egypt would mean subtracting EGP 277,564 million of customer money the bank exists to gather. There is no weighted average cost of capital here and no enterprise-to-equity bridge.

THE EQUIVALENT IS ON THE FUNDAMENTAL VALUATION TAB and it is a discounted cash flow in every sense that matters: a flow to the shareholder, projected five years, discounted at a cost of equity that glides with the central bank's published path, with a terminal value on a growth rate equal to terminal inflation.

The discounting mechanics are repeated here so a reader looking for them finds them.

THE BAND USED, AND WHY IT IS A BAND

The price-to-book band Egyptian large-cap banks trade in. It is a BAND and not a point because this study could not source a same-day book value for any Egyptian bank other than ADIB itself: the only peer whose price it holds on the same day is CIR and CIR's own

THE SECTOR FRAME

Egyptian private-sector credit is about 26% of GDP, down from 36% in 2009: the banking system has shrunk relative to the economy ADIB-Egypt is about 3.14% of that system credit and rising. The forecast takes it to about 4.42% by 2030. at a rate that decays A reader who believes credit deepening resumes should read the growth path as conservative: a reader who believes the
