

Testahil — ADNOC Logistics & Services plc (ADX: ADNOCLS)

Companion model · Independent Valuation Study · Educational analysis · Not investment advice

What this workbook is. A transparent companion to the ADNOC L&S valuation study. Every blue cell is an input; every black cell is a formula; green cells link across sheets.

IT IS FORMULA-DRIVEN. Every figure that can be derived arithmetically from a driver is a live formula, so you can change a blue cell on Assumptions and watch the model reprice. The cost of equity is built from the normalised risk-free rate, the beta and the equity risk premium — and the normalised rate is itself a formula, the observed government bond yield less the sovereign default spread. The cost of debt is built three separate ways on the sheet — the parent facility at the overnight financing rate plus its margin, a weighted blend of the instruments the company actually has outstanding, and the disclosed third-party bank-loan midpoint — and the three are averaged in a cell. The discount factors compound year on year of the cost-of-capital glide, with a three-quarter stub for 2026 because the valuation date is 31 March 2026. The tanker fleet is built vessel by vessel from the vessel counts and day rates on Assumptions; the balance sheet rolls property, plant and equipment, working capital, equity and net debt forward; and every ratio and per-share figure, including the conversion to dirhams at the fixed parity, is a formula.

THREE THINGS ARE PASTED VALUES, and it is worth knowing exactly which.

- (1) AUDITED AND DISCLOSED HISTORY — the primary record, not a calculation. Where a line is both disclosed and arithmetically derivable, the DISCLOSED figure is carried, because the filing is the record.
- (2) THE OUTPUT OF A UNIT BUILD that would be unreadable flattened into a grid — the historical segment revenue and earnings table, which the operating-segments note gives directly.
- (3) WHOLE-MODEL RE-RUNS, where each figure is a complete revaluation of the entire model and so carries a single formula: the Monte Carlo price map, the two sensitivity grids, the discounted-cash-flow bear and bull bounds (each of which re-runs the fleet build at a different rate anchor, a different beta — the two ends of the regression's own confidence interval — and a different capital-expenditure path) and the three expert-panel legs.

THE MONTE CARLO AND SENSITIVITY GRIDS DO NOT REDRAW WHEN A DRIVER IS CHANGED. Char reprices the whole valuation chain, but those grids are engine outputs and stay as they were run. Anything else pasted is a defect.

How revenue is built. Not as one growth rate. The tanker fleet is built vessel by vessel: fifty-three owned vessels split into those trading at spot rates and those on charters out at rates already fixed and disclosed, each class earning its own time-charter equivalent per day over 365 days, less an all-in running cost per vessel per day escalated on a services-and-wage escalator. The gas carriers are built from contracted vessel-years times an implied day rate. The five remaining units are grown on their own revenue and margin drivers, anchored on what each actually earned in the first quarter of 2026.

THE CONTESTED JUDGEMENT, PUBLISHED BOTH WAYS — HOW THE MARKET IS MEASURED. The stock's own returns is run against two different measures of its market, and the answer moves a long way between them. Against the published index of the exchange the share is listed on — the index the method asks for, and the primary reading — the beta is 1.085. Against an equal-weight composite of that same exchange's names, which gives its smallest listings the same say as its largest, the beta is 0.705. The published index is weighted by size and is therefore dominated by the very group this

company belongs to; the composite is not. That single difference in construction, and nothing about the company, moves the cost of equity and the cash-flow value materially. BOTH are carried through the model full, side by side, on the Summary, Fundamental Valuation and DCF sheets. They are NOT averaged into one number. The regression's own 90% confidence interval on the primary estimate runs 0.758 to 1.412, and those two bounds — not round numbers chosen by hand — are the betas used in the bear and bull cases, so the published range is the range the estimate itself supports.

What it is not. It is not investment advice, a recommendation, or a price target. Values are model outputs shown as ranges and distributions.

Sourcing note, up front. FY2023, FY2024 and FY2025 come from the company's own audited consolidated financial statements; the first quarter of 2026 comes from the reviewed interim statements; the fleet, rate and contract data come from the company's own investor presentations and earnings calls. Every input is listed with its value, source and date in the companion bibliography document.

Currency. US dollar thousand unless stated — the company reports in US dollars. Per-share figures are in dirhams at the fixed parity of 3.6725 dirhams to the dollar. Spot AED 6.16 (2026-08-07 close).

and is the primary reading. The equal-weight composite is what an earlier construction of this study use

nd, and it is kept in view because a difference of this size is a property of index construction rather than a

a fact about the company. The regression passes its usability gate, but the history is only three years lon

g and the 90% interval shown above spans more than half the point estimate, so the alternative is not a :

stress case — it is a second legitimate answer to the same question.

Assumptions — every input in the model

Blue cells are inputs. Change one and the model reprices: everything downstream is a formula

Market and share anchors

Share price (AED, Abu Dhabi Securities Exchange close)

Shares outstanding (mn)

Dirhams per US dollar (fixed parity, unchanged since 1997)

Stub year fraction — 31 March 2026 valuation date to 31 December 2026

First-quarter 2026 free cash flow, already inside net debt at the valuation date

Cost of capital

Observed government bond yield (dirham tranche maturing January 2031)

Sovereign default spread (netted out of the risk-free rate)

Beta — own-stock weekly regression against the published index of its own exchange

Beta — the same regression against an equal-weight composite of that exchange

Beta — lower bound of the regression's 90% confidence interval (the bull-case)

Beta — upper bound of the regression's 90% confidence interval (the bear-case)

Beta — lead-lag sum beta from the same series, one lead and two lags

Equity risk premium (mature premium plus country risk)

Terminal risk-free rate

Statutory corporate tax rate

Cost of debt — the evidence behind the three constructions

Secured overnight financing rate

Parent revolving credit facility margin

Third-party bank loans — low end of the disclosed range

Third-party bank loans — high end of the disclosed range

Other third-party borrowings — low end of the disclosed range

Other third-party borrowings — high end of the disclosed range

blished index of the exchange is what the method asks for and is the primary reading — it is weightec

l by size, and is therefore dominated by the same large-capitalisation group this company belongs to. Th

e equal-weight composite gives the exchange's smallest names the same say as its largest and is the con

struction an earlier version of this study used; it is published beside the primary reading because a gap

of this size is a fact about how the index is built, not about the company, and the reader is entitled to see

3 it. The gap between the two is the single most consequential judgement in this study.

Income statement — three years audited, five years forecast

USD thousand, consolidated. History is the audited record; every forecast line is a formula.
