

ADI

ADNOC Drilling Company P.J.S.C. — valuation model, 9 August 2026

THIS WORKBOOK CALCULATES.

Everything arithmetically derivable from a driver is a live formula. Change a blue cell on the Assumptions sheet and everything downstream is recalculated. The model is built in the sheet from the risk-free rate net of the sovereign default spread, the equity beta and the equity cost of capital; the weights come from the year Treasury yield and the company's own borrowing margin and then taxed; the weights come from net of capital; the waterfall chains EBITDA to EBIT to NOPAT to free cash flow to present value; the terminal value is a multiple of free cash flow; the return on capital; the statements roll forward; and every ratio and per-share figure is a formula.

THREE CLASSES OF CELL ARE PASTED, AND ONLY THREE.

1. Audited and disclosed history. The three years of income statement, balance sheet and cash flow come from the company's audited financial statements. Where a line is both disclosed and derivable, the DISCLOSED figure is carried — the model does not do arithmetic.
2. The output of the unit build. The rig delivery schedule on the Assumptions sheet is a fleet plan, not arithmetic. The number of rigs expected in service in each year. Everything downstream of it — average deployed rigs, revenue per class, etc. — is calculated.
3. Whole-model re-runs. The Monte Carlo sheet, the three grids on the Sensitivity sheet, and the Bear and Base Case Valuation sheets are pasted, because each cell in them is a complete revaluation at a different set of inputs. The model CHANGES. Everything else does — including both discounted-cash-flow cases, which are each built live from the unit build expenditure plan and the same cost stack.

One sheet is other companies' data.

The Peer and Sector sheet carries thirteen other listed drillers and oilfield-service companies. Their prices, enterprise values, and other metrics are pasted as observations. The only formulas on that sheet are the enterprise values and multiples calculated from ADNOC Drilling's own statements.

BLUE MEANS INPUT, BLACK MEANS FORMULA.

Every blue cell is on the Assumptions sheet, and every one of them carries its source and the construction of the formula.

WHERE THE NUMBERS COME FROM.

Every historical figure traces to ADNOC Drilling's own issued financial statements: the audited consolidated financial statements, the reviewed interim statements for the first quarter and first half of 2026, each downloaded from the company's website. Rig counts, wells drilled, integrated-services rig counts, unconventional revenue — come from the company's own statements, which is the only published source that carries them. The Peer and Sector sheet is the one place third-party data is used for a cross-check and for the relative lens, and none of it enters ADNOC Drilling's own statements.

CURRENCY.

The company reports in US dollars, which is its functional and presentation currency. Its shares trade in dirhams. The model runs in dollars and converts per-share figures at the peg of 3.6725 dirhams to the dollar.

WHAT THIS IS NOT.

This workbook contains no rating and no price target. It produces a fair-value range and a distribution of outcomes.

Summary valuation table

	AED per share
Discounted cash flow — continued expansion	6.21
Discounted cash flow — capacity plateau	5.40
Relative multiples	3.95
Book value and sustainable return	4.73
Normalised earnings power	3.46
Weighted central fair value	4.92
Market price, 07-Aug-2026	5.94
Central against the market price	-17.2%

MEMO

Terminal value as a share of enterprise value — continued expansion	76.0%
Terminal value as a share of enterprise value — capacity plateau	72.3%
Weighted average cost of capital — rating basis	8.01%
Weighted average cost of capital — credit-default-swap basis	8.05%
Market capitalisation (USD thousands)	25,866,943
Enterprise value at the market price (USD thousands)	28,025,482
Enterprise value / FY2026 guided EBITDA at the market price	12.90x
Segment-weighted peer enterprise value / EBITDA	8.66x

Weight	Bear	Bull
25.0%	5.66	6.86
25.0%	4.99	5.87
20.0%	2.99	4.64
15.0%	4.35	5.17

Market price	5.94
Central against the market price	-17.2%
Terminal value as a share of enterprise value (continued expansion)	76.0%

I central

Weight	Bear	Bull
25.0%	5.66	6.86
25.0%	4.99	5.87
20.0%	2.99	4.64
15.0%	4.35	5.17
15.0%	3.23	3.70
100.0%	4.40	5.44

What the lens is measuring

Free cash flow to the firm over five explicit years plus a terminal value, on a fleet plan that keeps building

The same waterfall on a fleet that stops growing once the capacity target is met

What the listed drilling and oilfield-services universe pays for a dollar of EBITDA, weighted to this company's own segment mix

The multiple of book a franchise earning this return on equity justifies

What the fleet already installed earns at the guided margin, with no growth credited

Assumptions — every blue cell is an input; change one and t

Uploaded ADX daily price history for ADNOC DRILL, last close 07-Aug-2026

AED/USD central-bank peg, unchanged since 1997; the rate at which the company itself translates its AED-currency amounts into the USD amounts disclosed in Note 24 of the audited statements

Share capital note 13, FY2025 audited statements: 16,000,000 thousand shares of AED 0.10 each, unchanged

Note 14, 1H-2026 interim: the appointed market maker held 7,349 thousand shares on the company's behalf, all of which are classified as treasury shares in equity (31 Dec 2025: 9,279 thousand)

US 10-year constant-maturity Treasury yield, Federal Reserve H.15 via the St. Louis Fed (series DGS10), 06-Aug-2026

Adjusted default spread for the United States (Moody's Aa1), Damodaran country default spreads and risk premium file, last updated 5 January 2026

Own-stock 5-year weekly regression against the FTSE ADX General Index — the headline index of the exchange actually trades on, held at engine/raw_indices/AE/ADXGENERAL.csv (3,884 sessions, 02-Jan-2011 to 24-Jul-2026, with blanks, duplicate dates, limit-exceeding single-session moves and trading-day density before use). n=247 weekly observations, R-squared 0.128, standard error 0.133, 90% interval 0.58 to 1.01. Clears the regression usability gate (n>=200, R-squared>=5%, standard error below the absolute beta), so the first tier of the beta hierarchy applies and no further tiers are needed. SUPERSEDES a prior 0.664 measured against an equal-weight composite of the 18-name UAE price index. The composite under-weights the large-capitalisation names the published index is concentrated in, and it is retained as a robustness check rather than as the regressor. The index series ends 24-Jul-2026 against a 07-Aug-2026 price. The price gap that costs the regression two of roughly 250 weekly observations. Source: engine/adnocdrill_study/beta/ADXGENERAL.csv. Equity risk premium for the Emirate of Abu Dhabi on the rating basis (mature-market premium plus the Abu Dhabi risk premium), Damodaran ctryprem file, 5 January 2026. FY2024 MD&A: 'offered at least one discrete service to an additional 48 rigs between onshore and offshore'

FY2025 management discussion and analysis: 'The segment offered at least one discrete service to an addi

between onshore and offshore in the fourth quarter. All in all, oilfield services are offered to 118 rigs'

1H-2026 management discussion and analysis: 30 regional rigs outside the UAE at 30 June 2026 — 8 in Om

the 70%-owned SLDC joint venture with SLB (completed January 2026) and 22 from the 80% stake in MBPS

1H-2026 management discussion and analysis: 'One additional AI-enabled Island rig entered the domestic fleet in the second quarter, ahead of schedule' — 12 at 31 December 2025 plus one

1H-2026 management discussion and analysis — integrated-drilling-services rigs at 30 June 2026

1H-2026 management discussion and analysis: 'at least one discrete service was delivered across an additional rig, resulting in OFS coverage across a total of 114 rigs'

FY2025 reported Onshore segment revenue less the unconventional land-drilling revenue inside it, over the FY2024 and FY2025 reported rig counts

Revenue per regional land rig-year, USD thousands. Derived, not assumed: 1H-2026 Onshore revenue of \$1.1 billion minus roughly \$35 million of unconventional land drilling leaves \$996 million; the Abu Dhabi conventional fleet at FY2025 realised rate accounts for approximately \$920 million of that, leaving about \$76 million earned across roughly 19 regional rigs in the half (8 SLDC rigs from January, 22 MBPS rigs part-period). That is about \$8.0 million per rig-year, roughly 40% of the Abu Dhabi rate, consistent with smaller land rigs on Oman and Kuwait terms. FY2023 is the last year the island and jack-up businesses were reported separately, so it is the only year that compares between them. Revenue per island rig-year over revenue per jack-up rig-year, both on that year

FY2025 reported Offshore segment revenue divided across jack-up-equivalent rig-years, island rigs counted

The jack-up rate at the FY2023 island-to-jack-up ratio

Oilfield Services serves TWO rig populations, and the company discloses both: the integrated-services fleet and the rigs given at least one discrete service. The first edition of this model recognised only the first

The same two populations a year later

FY2024 reported Oilfield Services revenue less the unconventional revenue inside it, over the rigs served

The same construction a year later

Measured, not assumed: what the company actually achieved between the two disclosed years. It fades to the base case escalator across the forecast, because a gain of this size in revenue per rig served is a mix and efficiency effect that could compound indefinitely

Contract day-rate escalator applied to the conventional revenue-per-rig price line. The customer is a single company on multi-year contracts, so realised day rates track a negotiated escalation rather than a spot market. Abu Dhabi onshore revenue per average deployed rig moved from \$18.9 million in FY2023 to \$20.9 million in FY2024 to \$22.9 million in FY2025 (this model's own unit arithmetic on disclosed segment revenue and disclosed rig counts) on a path that is up but not monotone. 1.5% is set at domestic inflation rather than extrapolating the FY2024 staff-cost escalator. United Arab Emirates consumer price inflation ran 1.63% in 2023, 1.66% in 2024 and 1.66% in 2025 (World Bank via the St. Louis Fed, series FPCPITOTLZGARE); 2.0% carries a modest real-wage drift above the market, competing for skilled rig crews in a tight regional labour market. Applies ONLY to the domestic labour line. Oilfield-services cost escalator, applied to repairs and maintenance, major maintenance and hire of equipment, follows the price index for drilling oil and gas wells (series PCU213111213111) stood at 396.978 in June 2026, down 1.6% from 2023, with a three-year compound rate of +0.29%. 1.5% sits above the flat recent print and below general inflation. The recent softness reflects the US land downturn rather than the Gulf market these costs are actually incurred, not flagged rather than smoothed away

Fuel and lubricants escalator. This is a globally traded input and is escalated on its own commodity path, NOT on general inflation proxy: Brent closed at \$88.90 on 03-Aug-2026 against a one-year average of \$79.69 and a three-year average of \$79.48 (US Energy Information Administration via the St. Louis Fed, series DCOILBRETEU). Spot sits roughly 10% above the three-year mean, so a flat nominal path embeds mean reversion in real terms. The company's onshore contracts have explicit fuel-escalation pass-through — the 1H-2026 MD&A attributes part of the onshore revenue increase to 'fuel escalation' — so this line is close to margin-neutral either way

Escalator for other direct cost and for general and administrative expenses, anchored on United Arab Emirates inflation (1.25% in 2025, 1.66% in 2024) rounded to 1.5%

EBITDA margin on unconventional revenue, triangulated three ways in the workbook rather than asserted: (i) the disclosed conventional EBITDA margin of 51% applied to conventional revenue implies \$50 million of EBITDA on \$980 million of unconventional revenue, a 7.3% margin; (ii) the same arithmetic on FY2024's disclosed 52% implies a negative margin on a \$117 million revenue base a half-point of rounding in the disclosed margin swings the answer by more than 10%, so it is reported and discarded; (iii) the FY2024-to-FY2025 incremental bridge — group EBITDA up \$183 million, of which \$869 million, of which \$294 million of conventional revenue at 51% explains \$150 million — leaves \$33 million of incremental unconventional revenue, a 5.8% margin. The average of the two usable estimates is 6.5%. The most consequential fact about the unconventional programme: it is a large revenue line that carries almost

Revenue, 1H-2026 condensed consolidated interim financial information (reviewed)

The same five lines the audited years are measured on

Working capital at 30 June 2026 over annualised first-half revenue. The first edition used the average of the years, every one of which pre-dates the two regional acquisitions, and applied it to a revenue line that includes the year balance sheet is not seasonally flattering here: over the first half of 2025 working capital RELEASED capital runs BELOW its year end at mid-year rather than above it

1H-2026 earnings press release guidance — Onshore revenue of approximately \$2 billion

1H-2026 earnings press release guidance — Offshore revenue of approximately \$1.5 billion

1H-2026 earnings press release guidance — Oilfield Services revenue of approximately \$1.5 billion

1H-2026 earnings press release guidance — dividend floor of \$1.05 billion, up 5% year on year

The guided floor is stated as 5% above the prior year

Terminal nominal growth under the continued-expansion framing. Sits below long-run United States inflation of 2.25% plus real regional activity growth, and below the 3.0% ceiling a mature contract driller could justify

Terminal nominal growth under the capacity-plateau framing — the domestic fleet stops growing once the fleet per-day capacity target is met, so nominal growth is contract escalation only

Terminal after-tax return on invested capital. The company earned a 23% return on capital employed in FY2025 and 1H-2026 (both disclosed in the MD&A financial summary). 18% fades that toward, but not to, a cost-of-capital of 10%. If the fleet is contracted to a single national oil company on terms that have sustained a 23% return through a full cycle, so a fade to parity would contradict the observed record, while holding 23% in perpetuity would capitalise a company that faces renegotiation at every contract roll

Share of results of joint ventures, 1H-2026 condensed consolidated interim financial information (reviewed) after income tax flows, 1H-2025 comparative column

Cash-flow statement adjustments, 1H-2026 condensed consolidated interim financial information (reviewed) after income tax equipment 252,319 plus right-of-use 5,906 plus intangibles 2,305

1H-2026 earnings press release full-year 2026 guidance — revenue of approximately \$5 billion, reaffirmed a full-year 2026 results

1H-2026 earnings press release guidance — EBITDA of \$2.2-2.3 billion

1H-2026 earnings press release guidance — EBITDA of \$2.2-2.3 billion

The company's own FY2026 guided group EBITDA margin — the midpoint of the guided EBITDA range over the next 12 months. Deliberately the GROUP margin and not the higher conventional-only margin guided separately, because the conventional-only lens includes the lower-margin oilfield-services book

The charge the fleet being priced actually carries: the first-half 2026 charge, annualised. The first edition seen in the study is between maintenance capital expenditure and the 2030 charge — but the 2030 charge belongs to a larger fleet and is allowed to price

Read live off the FY2025 column of the income statement in this workbook, which is itself built from the audited FY2025

The return on average equity this workbook itself forecasts for FY2030, read live off the forecast statements of comprehensive income. Used the FY2024-25 realised average of 36.7%, which was earned on a smaller balance sheet than the one used in the study, putting a historical return into a perpetual formula made this lens richer than the cash-flow model four sectors lens. Reason other than that the past was measured on less capital

Audited FY2025 plus the first half of 2026 less the first half of 2025, then less the share of joint-venture results. Every peer multiple in the table is an enterprise value struck today over that peer's last twelve months. The lens it is applied to are on the same footing — and the joint ventures are stripped out here because their carrying value is back on the bridge

Median of ADES Holding and Arabian Drilling on their own latest reported EBITDA and net debt, at market price as of 30 June 2026

Median of Helmerich & Payne, Nabors, Patterson-UTI and Precision Drilling

Median of Valaris, Noble and Borr Drilling

Median of SLB, Halliburton, Baker Hughes and Weatherford

The two discounted-cash-flow framings carry equal weight and half the total, because the study refuses to count the conventional-only lens; the remaining three lenses split the rest

The two discounted-cash-flow framings carry equal weight and half the total, because the study refuses to count the conventional-only lens; the remaining three lenses split the rest

re

Note

Present value of the explicit five years plus the discounted terminal value.

Discounting FY2026 cash flow by a full year places the answer at the START of FY2026, which is 31 December 2025 — six months before the balance sheet the deductions below come from

The share of the answer that rests on the period beyond 2030 — read this before the valuation

An enterprise compounds at its own cost of capital. Closing the six-month gap rather than ignoring it is what puts both sides of this bridge on one date

Reported, not forecast. Cash the enterprise has already handed out is no longer inside it. Acquisition consideration is deliberately NOT deducted here: it bought assets that sit inside the same enterprise, so it nets out of an enterprise-value roll-forward

Now on the same date as every line beneath it

Enersol and Turnwell at carrying value; their earnings are excluded from the discounted EBITDA, so the stake is added here instead

Balance sheet at 30 June 2026

Current and non-current term loans

The present value of the price at which the parent may be required to buy the 30% of SLDC and the 20% of MBPS it does not own. The minority interests reported at 30 June 2026 are NOT deducted as well: that is the same claim under another name, and the company has already charged a matching investment reserve against owners equity for it

The remaining 38 days from the balance-sheet date to the share price this value is compared against

Issued shares less the shares the appointed market maker holds on the company's behalf

Converted at the peg

From the FY2025 segment note

Average of the MENA national-oil-company drillers and the global land drillers

The multiple and the earnings it multiplies are on the same footing: every peer multiple above is an enterprise value struck today over that peer's last twelve months, and the joint-venture earnings are taken out here because the joint-venture carrying value is added back on the bridge below

The same bridge the cash-flow lenses use, and the minority is deducted once

The gap between this and the segment-weighted peer multiple is the whole of the relative lens

The rigs the company has ALREADY taken delivery of, at FY2025 realised rates. The first edition carried 14 island rigs and the 70 integrated rigs the company TARGETS for the end of 2026; the reported counts at 30 June 2026 are 13 and 61. A target is growth, and this lens is the one that credits none

The charge the fleet being priced actually carries, annualised off the first half of 2026

The first edition divided by the cost of capital LESS a terminal growth rate while the text beside it said no growth was credited. A denominator of cost-of-capital-minus-growth IS the growth credit; there is no other reason for the growth rate to appear in it

Highly geared to the denominator: with a cost of equity this close to the growth rate, a small move in either coordinate moves the multiple a long way. Read the sensitivity, not the point estimate

	This model's own 2030 balance sheet has the firm holding net cash. A self-audit of this study proposed capitalising the terminal block at the cost of equity on that basis, and it was accepted and priced before being implemented. It was then reversed. The capital-structure weights above are struck on GROSS debt, because interest is paid on the gross balance and cash is bridged separately — and a firm holding cash alongside undiminished gross borrowings has not de-levered. Reading the terminal structure off net debt after refusing to read today's off net debt is one quantity treated two ways. The terminal net debt is published here because it is worth seeing; it does not set the
