

Testahil — Americana Restaurants International PLC (Abu Dhabi Securities Exchange)

Companion model · Independent valuation study · Educational analysis · Not investment advice

WHAT THIS WORKBOOK IS. A transparent companion to the Americana Restaurants valuation study. Blue links are [hyperlinks](#) that jump across sheets.

IT CALCULATES. Every figure that can be derived arithmetically from a driver is a live formula, so you can watch the model reprice. The cost of capital is built from the risk-free rate, the sovereign spread, beta and the discount rate walks down is derived from the tax path. The discount factors compound. The cash-flow waterfall starts with EBIT after tax gives NOPAT, and free cash flow to the firm falls out of NOPAT, depreciation, capital expenditures and block chains too: the reinvestment rate is growth divided by the return on capital, and the terminal value falls out of the terminal cost of capital and growth. The statements roll forward — property, right-of-use assets, working capital — carry from one year to the next — and every ratio and per-share figure on every sheet is a formula.

FOUR CLASSES OF CELL ARE PASTED, AND ONLY FOUR.

1. Audited and disclosed history. The primary record is not a calculation. Where a line is both disclosed and audited, it is pasted.
2. The probability map. Each figure on the Monte Carlo sheet is the output of a fifty-thousand-path simulation.
3. The sensitivity grids. Each cell there is a complete re-run of the whole model with joint driver shifts, so it redraws when a driver is changed.
4. Two whole-model re-runs named individually: the bear and bull of the cash-flow lens on the Summary sheet, 1.5 points, cost of capital minus or plus 1.5 points, terminal growth 2% or 4%, like-for-like plus or minus 1 point. The cost reading on the Fundamental Valuation sheet. The expert panel, both readings of the margin question, and the LIVE FORMULAS in this edition.

Anything else pasted would be a defect. The formula and pasted-value counts are reported at the foot of the sheets.

HOW REVENUE IS BUILT. Not as one growth rate. The restaurant estate is disclosed country by country and for the same units, so revenue is built as restaurants times revenue per restaurant across seven market units. The net-new-store guidance; the revenue per restaurant grows on disclosed like-for-like sales growth, less a currency effect. Currencies are not pegged to the dollar. The build reproduces reported revenue exactly in all three audited years. It is an input: eight cost classes are each escalated on their own driver, never on one blended index.

CURRENCY. The company reports in US dollars. The shares trade in dirhams in Abu Dhabi and in riyals in Saudi Arabia. The dollar since 1997. The model runs in US dollars — the reporting and functional currency — and converts to local currencies unless stated; per-share figures are shown in both currencies.

THE OPEN QUESTION. Between the first half of 2025 and the first half of 2026 the EBITDA margin went from 18% to 22%. Cyclical is the single judgement that decides this valuation, and nothing in the filings settles it. Both readings are shown on the Summary and Fundamental Valuation sheets. They are not averaged.

WHAT IT IS NOT. It is not investment advice, a recommendation, or a price target. Values are model outputs.

COUNTS. This workbook carries 897 formula cells against 406 pasted values — 307 audited sensitivity-grid cells. Every one of the 897 formula cells is checked against the model that w

Summary — the valuation at a glance

Book value and sustainable return

Weighted central

THE OPEN QUESTION — the margin, computed both ways

Structural — the gains hold and improve slowly

Cyclical — the gains are competed away

The gap

Both readings are LIVE in this workbook: the structural value is the DCF sheet headline and the cyclical value is the parallel formula block at the foot of the DCF sheet, sharing every driver except the margin path. They are published side by side and never averaged.

A SECOND READING — how the lease estate is treated

Leases capitalised, as the accounts present them

Leases as an operating cost

The gap

The two readings differ by under two percent once each is built consistently — charging the right-of-use additions as investment on the capitalised reading, and charging the whole rent bill as a cost on the other. That is a result worth stating: the accounting choice that dominates the balance sheet

Enterprise value to equity — the bridge

A single operating business, so the bridge is one leg, not a sum of parts. Every line is

Step

Present value of the five forecast years

Present value of the terminal value

Enterprise value

Less lease liabilities

Plus cash and bank deposits

Less bank debt

Less non-controlling interests

Equity attributable to shareholders

Terminal value as a share of enterprise value

Present value of the five forecast years, as a share of enterprise value

Just over half the enterprise value sits beyond the fifth forecast year. That is what a growing business with a nine-and-a-half per cent cost of capital and three per cent long-run growth looks like, and it is the reason the terminal assumptions are sensitised on their own sheet rather than buried.

Trailing enterprise value / EBITDA

Trailing price / earnings

Trailing price / book

Net debt / EBITDA

Normalised earnings lens — the mid-cycle margin at today's scale

Current-scale revenue, FY2026E (USD million)

Mid-cycle EBITDA margin — the midpoint of the structural and cyclical FY2028 readings

Normalised EBITDA (USD million)

Less depreciation and amortisation

Normalised EBIT, after the recurring impairment charge (USD million)

Net finance result (USD million)

Normalised earnings after tax (USD million)

Normalised earnings per share (USD)

Justified price / earnings

Implied value per share (AED), rolled to the anchor

Bear at 13 times (column C) and bull at 21 times (column D)

Book value and sustainable return

Book value per share (USD)

Sustainable return on equity

Trailing return on equity

Terminal cost of equity

Justified price / book

Implied value per share (AED), rolled from the book date to the anchor

Bear at a 34% return (column C) and bull at 48% (column D)

The book lens is the weakest of the four here and carries the lowest weight for that reason. An operator that leases its estate and distributes almost all its earnings holds very little book equity, so a justified price-to-book multiple divides a large return by a small base and is unstable in both directions.

Terminal cost of capital

Terminal value

Present value of the five forecast years

Present value of the terminal value

Enterprise value

Terminal value as a share of enterprise value

Less lease liabilities

Plus cash and bank deposits

Less bank debt

Less non-controlling interests

Equity value

Fair value per share at 31 December 2025 (USD)

Fair value per share at the 7 August 2026 anchor (AED) — rolled at the cc

THE COST OF CAPITAL — BUILT HERE, NOT PASTED

The glide

Effective tax rate path

Glide fraction — cumulative progress of the tax path

Row 17 walks the explicit-window cost of capital down to the terminal rate on this fraction, so the shape of the path is inherited from the only forward schedule in the model rather than invented as a second free parameter.

Cost of capital, explicit window

US ten-year Treasury yield

Less the US sovereign default spread

Risk-free rate net of the sovereign spread

Beta

Blended equity risk premium (ratings basis)

Cost of equity

Cost of capital, terminal

Cost of debt — the group's own incremental borrowing rate

Cost of debt after tax

Market capitalisation (USD million)

Debt at market value — the lease liability

Debt weight

Equity weight

Terminal risk-free rate

Terminal cost of equity

Terminal cost of debt after tax

Model-implied average return on closing invested capital (the bull reading)

The same cost of capital on the credit-default-swap basis

Risk-free rate net of the US sovereign credit-default-swap spread

Blended equity risk premium (credit-default-swap basis)

Cost of equity, credit-default-swap basis

Cost of capital, credit-default-swap basis

Both bases are published. The default spread stripped out of the risk-free rate is on the same basis as the premium added back, so sovereign risk is counted once and once only.

THE OTHER READING OF THE OPEN QUESTION — the cyclical margin, c

Cyclical EBITDA margin path

EBITDA on the cyclical path

NOPAT on the cyclical path

Free cash flow to the firm, cyclical

Present value

Terminal value, cyclical

Equity value, cyclical

Value per share on the cyclical reading (AED), rolled to the anchor

Every cell in this block is a live formula: the cyclical reading shares the revenue, depreciation, capital-expenditure and working-capital lines of the base case and differs only in the margin path, so it can be — and is — computed in the sheet rather than pasted.

is inherited from the tax path, the discount factors compound, and the terminal value is capital

Income statement — three years of history, five of forecast

USD million, consolidated. Every historical figure is the audited record; every forecast

USD million

Revenue

Cost of revenues

Gross profit

EBITDA

EBITDA margin

Depreciation and amortisation

EBIT, before the impairment line beneath

Impairment losses — audited history, and the recurring charge in the forecast

Finance income

Finance costs

Profit before tax

Income tax and zakat

Profit for the year

Non-controlling interests

Profit attributable to shareholders

Earnings per share (USD)

EBIT here is EBITDA less depreciation, so it sits ABOVE the impairment charges; the audited operating profit is EBIT after those charges. Impairments are a recurring feature of a large restaurant estate — some brand-country units are always underperforming — but they are not forecast as a line, so the forecast columns carry none and the free-cash-flow waterfall is struck before them. The non-controlling

it

line is a formula.

Balance sheet — condensed, three years of history and five

USD million. Every historical line is the audited closing figure. Every forecast line rolls

USD million

Property, equipment, intangibles and investment property

Right-of-use assets

Inventories

Trade and other receivables

Cash and bank deposits

Net working capital

Payables, tax and provisions (the company's own working-capital aggregate)

Lease liabilities

Bank debt

Equity attributable to shareholders

Non-controlling interests

Total assets

Net debt — lease liabilities and bank debt less cash and deposits

Invested capital — owned assets, right-of-use assets and working capital

Return on invested capital

Net debt / EBITDA

This is a CONDENSED layout: it does not foot to zero, because the provisions, employee end-of-service liability, deferred tax and related-party balances are not shown as separate lines. The lines that do appear are the audited closing figures.

Summary of forecast

From FY2026 forward: assets from capital expenditure less depreciation, working capital off revenue

Cash flow — historical markers and the forecast waterfall

USD million. The forecast columns are the engine of the whole model: the depreciation

USD million

EBITDA

Owned-asset depreciation and amortisation

Right-of-use depreciation

Depreciation and amortisation

Gross openings — net additions plus closures

Owned capital expenditure

Additions to right-of-use assets

Capital expenditure, including right-of-use additions

Change in net working capital

Tax

Free cash flow to the firm

Lease payments — principal and interest

Dividends paid

Movement in cash and deposits

Cash and deposits, closing

Cash generated from operations, as reported

The forecast free-cash-flow line is free cash flow to the FIRM on the capitalised-lease reading: taking a new restaurant lease is an investment, so right-of-use additions are charged as capital expenditure and the matching lease liability is deducted in the bridge to equity. Adding back right-of-use depreciation without charging the additions would count the shield and never pay for the asset.

ι, capital-expenditure and working-capital lines the discounted cash flow reads are com

	2.23	2.48	2.96	50.1%

ot redraw when a driver changes.

Sensitivity — what the valuation needs the world to do

AED per share. Each cell is a complete re-run of the model, including the unit build, so these are

Cost of capital (rows) against terminal growth (columns)

	2.0%
8.73%	2.38
9.48%	2.12
10.23%	1.90
10.98%	1.72
11.73%	1.57

Cost of capital (rows) against the EBITDA margin (columns)

	-2.0pp
8.73%	2.25
9.48%	1.96
10.23%	1.73
10.98%	1.55
11.73%	1.40

One driver at a time — five re-runs a row, the grid shown beside the name

Like-for-like sales growth (−1.0pp / −0.5pp / base / +0.5pp / +1.0pp)	1.93
EBITDA margin (−2.0pp / −1.0pp / base / +1.0pp / +2.0pp)	1.73
Cost of capital (−1.5pp / −0.75pp / base / +0.75pp / +1.5pp)	2.66
Terminal growth (2.0% / 2.5% / 3.0% / 3.5% / 4.0%)	1.90

The margin row is the one that matters. A two-point swing in the EBITDA margin is worth more than the whole plausible range of the cost of capital, which is why the structural-versus-cyclical question is the study's central judgement rather than a footnote.

grids are engine outputs rather than formulas and do NOT redraw when a driver is changed.

Domino's Pizza	United States	16.19x
Peer median, enterprise value / EBITDA — MEDIAN over the		16.88x
Peer median, price / earnings — MEDIAN over the rows inside the stated ba		
Americana — trailing enterprise value / EBITDA		8.93x
Americana — trailing price / earnings		
Justified multiple applied in the relative lens		8.50x

The set splits cleanly in two, and that split is why the justified multiple sits below the peer median. The global names — Yum! Brands, Restaurant Brands, Domino's — are franchisORS: they collect a royalty on someone else's sales and carry EBITDA margins of 20% to 35% on a fraction of the revenue. Americana is on the other side of that contract. It is the operator, it PAYS the royalty (5.6% of revenue in FY2025), and it
