

Country Risk Premiums

To estimate the equity risk premium for a country, I start with a mature market. Use the look up table in the next worksheet, to look up the statistics for a

Step 1: Estimating mature market risk premium

To estimate the mature market risk premium, I start with the implied equity risk premium. Link to site: <http://www.damodaran.com>

Historical monthly ERP: <https://pages.stern.nyu.edu/~adamodar/pc/implpr>

Until the January 2025 update, I used the S&P's equity risk premium as the mature market risk premium.

On May 16, 2025, Moody's downgraded the US from Aaa to Aa1. To get the mature market risk premium, I use the S&P's equity risk premium.

Mature market premium = ERP for the S&P 500 minus (Default spread for the US)

In January 2026, for example, when the implied ERP for the S&P 500 was 4.61%,

Mature market premium = $4.61\% - (0.23\% \times 1.52) = 4.23\%$

Step 2: Estimate the default spread for the country in question. I use Moody's ratings.

Moody's ratings: <http://www.moody's.com> (You will have to register, but

Ratings to spreads: Based upon my estimates of typical spreads for each rating.

CDS spreads: Bloomberg

If you cannot find a country on this list, it is because that country does not have a rating.

Step 3: Convert the default spread into a country risk premium

With sovereign ratings default spreads, you have two choices:

Choice 1: Use the default spread as the measure of the additional country risk premium.

Choice 2: Scale the default spread up to reflect the higher risk of equity in a country.

With CDS spreads, I compute the base number in two steps

Substep 1: Since the base equity premium is for a mature market (assumed to be the US),

Substep 2: I apply the scaling factor that you chose for the default spread to the base number. I prefer not to scale the default spread.

Step 4: Compute a total equity risk premium

Add the mature market premium from step 1 to the country risk premium.

Step 5: Compute regional averages and regional weighted averages

For the regional averages, I use a simple average of the total and country risk premium.

For the weighted averages, I use the World Bank GDP estimates from the same year.

If you are interested in a fuller explanation of these concepts, try these resources:

Update Notes

The starting point for the mature market premiums is the implied equity risk premium for the S&P 500. You can review the calculation in this spreadsheet. (<https://pages.stern.nyu.edu/~adamodar/pc/implprem/ERPJan26.xlsx>). I net out a riskfree rate in US dollars, which is the treasury bond rate adjusted for the default spread for the US, to get an equity risk premium for the US. I then back out the US default spread to get a mature market premium.

ERP for US = Implied Expected Return on US stocks - (US 10-yr T.Bond - Default spread for US)

Mature market ERP = ERP for US - Default spread for US

The ratings (Moody's and S&P) have been updated to reflect the most recent ratings. (See **Ratings Worksheet**)

The change in default spreads is computed by looking at percentage changes in sovereign CDS spreads over the period. (See **Default Spreads for Ratings** worksheet)

The biggest change in this update is in this measure. For the last few years, I have used the coefficient of variation in emerging market bond yields and the standard deviation of returns in emerging market equities. In this iteration, I have replaced the former with the standard deviation in emerging market sovereign bond ETF returns, thus creating more consistency in the calculations. While this change does not create a substantive shift in the numbers in this iteration, I think it is a more solid basis for computing this value in future ones.

The combination of a lower base mature market premium and lower sovereign default spreads has led to lower equity risk premiums across the board, a climb down from historically high numbers at the start of the year.

To look up the equity risk premium for a country, use this

Country	Turkey	<i>If you cannot or a sovereign</i>
Moody's sovereign rating	Ba3	Local currency
S&P sovereign rating	BB-	Local currency
CDS spread	2.99%	
Excess CDS spread (over Swiss C	2.85%	
Country Default Spread (based on	3.06%	
Country Risk Premium (Rating)	4.66%	
Equity Risk Premium (Rating)	8.89%	
Country Risk Premium (CDS)	4.34%	
Equity Risk Premium (CDS)	8.57%	

To look up the equity risk premium for a region, use this

Region	Asia
Country Risk Premium (simple average)	4.83%
Total Equity Risk Premium (simple average)	9.06%
Country Risk Premium (GDP weighted)	1.49%
Total Equity Risk Premium (GDP weighted)	5.72%

To construct your own regional ERP, use the data on GDP and ERP for countries in the region.

For countries not on the list above, try this frontier market

Country	Zimbabwe

Following my attempts to estimate the relative equity market volatility, I know that I have struggled with estimating market sovereign bonds, and have used the coefficient of variation in yields to make that estimate with a return on an emerging market government bond ETF from iShares. The standard deviation for emerging equities and emerging government bonds. (Using the old yield coefficient of variation of 49 in this computation.)
