

Testahil — Fertiglobe plc (ADX: FERTIGLB)

Companion model · Independent valuation study · Educational analysis · Not investment advice

What this workbook is. A transparent companion to the Fertiglobe valuation study. Blue cells are inputs; black cells are formulas; green cells link to another sheet in this workbook.

IT CALCULATES, IT DOES NOT STORE. Every figure that can be derived from a driver is a live formula, so you can change a blue cell on Assumptions and watch the model reprice. The cost of capital is built in the sheet — the Abu Dhabi US dollar sovereign yield less its own default spread gives the normalised risk-free rate, beta times the equity risk premium gives the cost of equity, the cost of debt is taken after tax, and the weights come from net debt and market capitalisation. The glide fractions are shown as they are derived and the discount factors compound, each one the year before divided by one plus that year's cost of capital. The unit build multiplies volume by price and by cost per tonne. The balance sheet rolls property forward as prior plus capital expenditure less depreciation, and rolls working capital off the collection, inventory and payment days measured on the audited statements. Every ratio and per-share figure on every sheet is computed where it is shown.

THREE THINGS ARE PASTED VALUES, and it is worth knowing exactly which.

1. Audited and disclosed history. The primary record is not a calculation. Where a line is both disclosed and derivable the DISCLOSED figure is carried, and the subtotals above and below it are formulas that have to reconcile to it — gross profit, operating profit, profit before tax, profit for the year and profit to owners are all computed from the disclosed components.
2. The output of the unit build. The disclosed sales volumes, own-produced segment revenue and EBITDA, and the published urea and ammonia benchmark prices for the three reported periods sit on the Segments sheet as the raw material for two regressions. Everything downstream of them — the realisation factor against the benchmark and the cost pass-through slope and intercept — is computed in front of you, and the whole forecast cost stack is built from those two.
3. Whole-model re-runs. The probabilistic price map on the Monte Carlo sheet and every grid on the Sensitivity sheet are complete revaluations of the model, one per cell, so they cannot be a single formula. THESE GRIDS DO NOT REDRAW WHEN A DRIVER IS CHANGED. Change a blue cell, the valuation moves; the price map and the sensitivity grids stay as they were computed.

Anything else that is pasted is a defect.

How the forecast is built. Not as one growth rate. Volume is installed capacity times a utilisation path, split between urea and merchant ammonia. Price is the published benchmark for each product, blended at the volume mix and multiplied by the realisation the company has actually achieved against that benchmark in each of the three reported periods. Revenue is volume times price divided by a thousand. Cash cost per tonne is an intercept plus a slope times the realised price, both of them regressed on the sheet from the same three periods, because the Egyptian and Algerian gas contracts are product-linked — the cost side moves with the price side rather than with a consumer price index. Margin is an OUTPUT of that build, never an input.

The contested judgement, carried both ways and never averaged into one number. Framing A treats the

2026 nitrogen price as a war premium on top of a marginal-cost anchor and lets it revert. Framing B takes the company's own sourced supply and demand balance and the European tariff wall on Russian product and holds prices near recent levels. Both are built in full, both are discounted, both reach a value per share, and both are shown side by side on the Summary, Fundamental Valuation, SOTP Bridge and DCF sheets. The cash-flow lens is their average.

The 2026 half-year is already reported, so it is not forecast. The first six months of 2026 are the disclosed actual and only the second half is modelled; the splice is shown on the Segments sheet.

What it is not. It is not investment advice, a recommendation, or a price target. Values are model outputs shown as ranges and distributions.

Currency. The group reports and functions in US dollars, and the shares trade in dirhams on the Abu Dhabi exchange. The model runs in US dollars, in millions, and translates at the fixed peg of 3.6725 dirhams to the dollar only at the last step. Market price AED 2.54 at the 2026-08-07 close.

1.741	1.758	1.777	1.797	0.072

e width of the range the four lenses already span; the pass-through moves it by more than the whole

nged.

e of that range, which is why it is measured on the Segments sheet from the company's own repor

ted periods rather than assumed.

Per-share and ratio analysis

The indicator set for a merchant nitrogen producer. Every ratio is a formula off the statements.

Measure	FY2023
Earnings per share (\$)	0.042
Earnings per share (AED)	0.155
Book value per share (\$)	0.175
Free cash flow per share (\$)	-
Dividend per share (\$)	-
Gross margin	35.3%
EBITDA margin	40.9%
EBIT margin	29.4%
Net margin, attributable	14.4%
Return on equity, on opening equity	-
Return on invested capital	-
Net debt / EBITDA	1.01x
Interest cover (EBIT over the net finance charge)	5.79x
Net working capital / revenue	5.0%
Capital expenditure / revenue	4.7%
Cash cost per tonne of own product (\$/t)	-
Realised price per tonne of own product (\$/t)	-

The forecast columns are framing A. Return on equity is struck on opening equity rather than an i

Yara International	NO	5.20x
OCI Global	NL	5.60x
Industries Qatar	QA	9.10x
SABIC Agri-Nutrients	SA	10.40x
Peer median		6.75x
Peer average		7.30x
Applied in the relative lens		5.80x

The company on its own multiples	Value
Trailing enterprise value / EBITDA	4.44x
Trailing price / earnings	9.13x
Trailing price / book	4.21x
Terminal value implied enterprise value / EBITDA, framing A	5.53x
Terminal value implied enterprise value / EBITDA, framing B	6.53x

The two Gulf names trade where they do because of who owns them and where they list, not because th

ime gas position.

Why it is and is not comparable

diversified nutrient, retail attached

pure nitrogen, Henry Hub advantaged

nitrogen, European gas cost

nitrogen and methanol

Gulf petrochemical and fertiliser

Gulf nitrogen, Tadawul rating

their nitrogen assets are worth more per tonne; the two American names sit on a gas position that

is structurally cheaper than anything in this group. The applied multiple sits below the peer median for

· that reason.
